I've just joined this site, hoping to find an email link to them.

I'm missing something, or the link doesn't exist.

Does anyone have an email address for them? Or if someone who is involved with the site could email me. It would be much appreciated.

Thanks.

Ken

"Michael and Nicole Freeman" <nameerf@flash.net> wrote in message
news:BB061DB0.320C4%nameerf@flash.net...
> Another thing to consider, along these lines of thought, is that Atari of
> the late 70's and early 80's, under Nolan Bushnell, went bankrupt and was
> bought by the Tramiels.

Uh... noooooooo.

The Bushnell era was sold out to Warner Comm. quite early on, which in '84
(I believe) was sold off to the Tramiels, who left the arcade division to
Warner, while taking on the home hardware (games/computers) division.

> So which one
> is the "real" Atari?

The "real Atari" is the "company" Atari (finally we have that back! Yea!)
and the products it makes. "Atari" (what it represented as a business),
from Bushnell through to the end of the Tramiel era was *ALWAYS*, in my
mind, the "real Atari". As long as they made game systems or computers,
they were the "real Atari". When they were sold out to JTS, they fell into
a dark void of vaporish doom (nothing done at all), which was really only
partially eleviated (but more like horribly MUTILATED) during the Hasbro era
and then slightly improved during the Infogrames era... finally being set
free, when Infogrames changed their name TO Atari, Inc. across the globe!

Do I feel we have the "real Atari" back today? Yes and no. The feeling of
victory gained by seeing a company take a brandname ("Atari") and then
BECOME than name, gives me great joy. But... beneathe the name, one still
realizes that, until "Atarigrames" (ooh, what a name!) starts making some
form of gaming or computer hardware again, they will always still be
remembered as "Infogrames" with the name Atari, Inc drapped across their
shoulders. A form of "wolf in sheep's clothing", if you will, but not quite
as bad.

There is happiness along with some lingering sadness. I only hope the
sadness is lifted completely with as much thrill and awe as I felt the day I
found out Infogrames *became* Atari! But only hardware by Atari will
accomplish this...

> Anyway, I too would love to have the good old glory days of Atari back.
But
> those days are over. Now we have a new Atari that at least recognizes on
> some level the greatness of the old Atari.

Well, they certainly deemed the name Atari better than their own
(Infogrames), across the world. There is some sense of loss on the loss of
"Infogrames", however... they made great software! They held a place of

high esteem in the ST days! Why must one die to let the other live? Let Atari, Inc. become it's own hardware entity again and let Infogrames shuffle the software around, like the old days!

> We also have Atari clones and
> upgrades to our old machines still being developed, albeit under different
> names. But isn't that just an issue of label? As far as I'm concerned, if
we
> can still get what we need for our machines, Atari is still around, if
only
> in spirit.

I can't stand fumes of old death ("in spirit")... if it's not the direct by-product (clone) of a *living* Atari (which makes hardware that the clones are fashioned after), then I just can't see using it, nor do I see any lasting viability therein. I think the weak upgrade market and stagnating clone projects today testify of this. Whereas, I believe if Atari were to start making computer hardware again, the market for Atari clones would easily be revived, because there is now REASON to buy such...

And hey, at least Infogrames/Atari uses the "real" Fuji symbol,
> where Hasbro/Atari used some botched-up imitator.

The "Atarigrames" of today uses a slightly modified version of the "true fuji". It's an annoying difference for a purist like me, but close enough to the original to accept without too much grief.

> to do with each other.

The sad thing is, that in any industry, these people are replace by accountants and men in business suits. Dreamers and creators make glorious products, but they generally are lousy busimess people. I suspect the vast majority of these people have moved on, possibly even retired, and may not have any interest at all in an attempt to repeat the process.

As it so happens, Jeep made pickups for years and years, all the way back to the old Willys Jeep Overland days. When acquired by Chrysler as part of AMC, Jeep produce a compact, the Comanche, and a 1/2 ton, J-10, and 3/4 ton, the J-20. Chrysler dropped the pickups. I heard they didn't want them competing with the Dodge products, but my personal suspicion is they probably considered the pickups to be a money losing venture.

You gotta be frickin' kidding me! REALLY? Those calcs were around right after Atari bought up Federated! Oh, boy, that is too funny! Maybe that's why they killed themselves in the dumphole. They were "focus shifting"! Hey, come to think of it, that's how Be, Inc. killed themselves! Hmm... strange co-incidence or history repeating itself?

"Beware the evil, but extremely seducing and alluring, 'focus shift'... it will KILL YOUR COMPANY!"

> The guy had some pretty weird ideas. No wonder the company went into

> happy!

I see this as the "preaching to the choir" perspective. Unfortunately, this choir is shrinking. So anyone wishing to make such a computer AND make a profit will have to go for the converts. It's just not possible otherwise.

The lack of profit is easily identified by how many software makers still support this platform. AFAIK, the last version of Calamus for the Atari has been released, this hardware doesn't have the horsepower to run the program anymore. And ROM says the next version of Papyrus will be the last version produced for the Atari.

Do we have a modern spreadsheet? Not to my knowledge.

Do we have a modern database program? Not to my knowledge.

Do we have a modern graphic appication of any kind? Not to my knowledge.

Do we have a modern presentation program? I.E, a PowerPoint type program. Not to my knowledge.

Do we have a modern CAD program? Not to my knowledge.

By modern, I mean software that can stand head to toe with similar programs available on other platforms. This will be absolutely necessary to gain the converts you will need to be profitable in any new hardware venture.

Shoot, we don't even have a browser that can access all websites out there. At least..... Not to my knowledge! :-)

If we could all just win a few Powerball lotteries....

I have an old copy of XFormer for the ST. Works pretty good. I use
800xlDJ on my Hades. It uses the SIO2PC cable that APE uses and
emulates an Atari 8-bit disk drive. Great program...

When I used ICD, if I set ICD to boot in 256 colors, I would get the
boot splash screen in 256 colors. Now, even though I use boot config
to set the system to boot in 256 colors, I get the 2 color mono
splash screen, and then MagiC boots in 256 colors as normal.

>I dug out my old 'ST Internals' and looked through
>your code. I didn't check too many details, you
>obviously know what you're doing.

I really wish I did :) I've a good idea what I should be doing, and I wrote the code to try and do it. It seems to partially work, in that I get some of the stuff written to the port. I don't get it all and I thing that is because the machine I'm using to write to the port is sending much too fast for the ST to keep up. A 300MHz Pentium sending to a 8MHz ST just doesn't seem fair but the Pentium is the slowest machine I have.

<Snip>

>Is Kenneth using an assembler program?
>I only saw this GFA code, and I don't see how
>it can work. There's no test of the BUSY (strobe)
>line from the sender, either by interrupt or polling.
>Or does INP(0) look after that?

No, INP(0) just reads from the printer port. Without my buffer, it waits until there's a byte to be read before reading and returning it.

Looking at the code:

>DO
> ' ~XBIOS(29,NOT strobe.bit%) !STROBE low

This sets the STROBE low, which makes it appear the ST is no longer busy.

> ' ~XBIOS(30,strobe.bit%) !STROBE high

And this line sets the STROBE high again. This make it appear the ST is busy again.

I'm guessing that in the time taken for the high->low->high transition, there would be at least 1 byte written.

> PRINT INP(0);" ";

I'm guessing that this should have been INP?(0) but, without my code, this will always instantly return. TOS hasn't implemented an input buffer for the printer port so there was no reason to say whether there was anything available to read, or not. As an INP(0), this tried to read from the printer port and sits there, forever if required, waiting for a

byte to arrive.

> ' PRINT CHR$(BIOS(2,0)); !Read from PRN

This is the same as INP(0) and the same info applies.

>LOOP UNTIL INKEY$=" "

>The correct procedure is exactly what you did
>in your assembler program, though checking
>the STROBE could be acheived by inefficient
>polling...

I wrote my code as a general purpose method of reading inbound data and it seems that I'm missing something since it doesn't work quite as it should. I altered the busy interrupt trigger from the low->high transition to the high->low so as to try speed up the transfer and make the reading more reliable. Unfortunately even that didn't seem to make it work better.

I think I may have to write a single-tasking, resource-hogging, app that is specific to reading ASCII/text sent to the ST, and that ends the transfer after a particular byte-sequence is received. What I think I'll end up with is possibly something along these lines:

```
set exit byte count to 3 ; use FF ESC @ as exit sequence
loop:
is temp buffer full?
if yes, write out and empty buffer

set STROBE low ; we ain't busy
loop2:
poll BUSY ; is their STROBE low?
if high, go to loop2 ; no

set STROBE high ; now we're busy
read byte direct from hardware
write byte to temp buffer ; 1k buffer, emptied when full
; or exit sequence found.
if exit byte = 3
is value 0x0c (FF)? ; first byte in exit sequence
if matches set exit byte count to 2 and go to loop

if exit byte = 2
is value 0x1b (ESC)? ; second byte in exit sequence
if matches set exit byte count to 1 and go to loop

if exit byte = 1
is value 0x40 (@)? ; third byte in exit sequence
if matches set exit byte count to 0 and exit loop

reset exit byte count to 3

go to loop
```

is temp buffer empty?
if no, write out buffer and quit

I picked FF ESC @ as the exit sequence as that sequence ejects the page and resets the printer and this sequence is unlikely to occur in an ASCII/text printout. Ensuring that this sequence is sent at the end of a transmission may be a problem for the OP.

Regards,
David Bolt

Hello,

I apologize for English in Non-english groups. I'm looking for assistance with a video card I have. The driver detects a: Matrix Moco with 256K of memory. A resolution of 1280x960x1 bit works but I believe it could possibly be TTL as I can't get it to work on my monitor.

The card has an expansion board that is supposed to make it true color. These are the pictures later on in the folder. It attaches to the 20 pin connector on the main card. There's 4-8 wires that need to be connected to assorted points on the Moco VME card. Does anyone have instructions on how to fix this card so that the truecolor works?

Also can someone accurately identify that this is a Coco card?

Here are a series of pictures. The first few are of the video card itself, the second few are of the expansion board that rests on top of the card.

http://aoi.atari-source.com/~mduckworth/matrix_pics/

Thanks
Mark

^^^^^^^
Oops, typo alert!!! There's a missing '.' above.

The URL should read:

<URL:http://www.my-ste.demon.co.uk/frontier/index.htm>

>You were the guy, where I got the files from IIRC, right ?

I am :)

>I'm giving you credit in the next few days on the homepage (I deleted
>yr mails to early, so I forgot yr name ... oops-sorry ;))

No worries.

>Regards and heff fun ;)

I am doing. I managed to get hold of another ST, originally for
programming purposes, and now I have one I don't need an emulator to
play again. It feels nice to be able to play it on the proper hardware
again :)

Regards,
David Bolt

to happen.

You just aren't thinking the right way... 10x the money of Bill Gates isn't anywhere NEAR needed! We're not trying to build a 14 TrigaHertz multi-mainframe, parallel processing "we can beat that russian chess player" size computer. We're aiming to build a computer that is only significantly faster/better than anything currently available in the Atari using sector.

Gone are the days of "Wow! An 8Mhz 68000 with 1Mb of RAM for only $999.99!". You can NOT play that game anymore. Technology has long since past it's zenith of "slow growth" and is simply speeding along as fast as people can make it faster and better! The age of "Wow! I didn't know a computer could do that!" or "Gee, they eeked out all 512 colors in that Carebears demo!" are long gone. We are far too jaded by technology today. 1Ghz? 2Ghz? 3Ghz? Eh, who cares. 1Million polygons or 50Million. You decide how many you want! 12 billion framerate game speed and a 3DMark score of 14 trillion 3D Marks?
Blah... just gimme more! That's all I care about... Mo' speed! Mo' power! Mo' diskspace! Mo' framerates! Mo' polygons! Mo' online bandwidth! ARRRRRGH! It's gotten absolutely INSANE!

If we look to where the masses are, we will be sorely disappointed by ANYTHING less powerful than that. We can no longer boast how much faster our 8MHz 1040ST is compared to a 4.77MHz IBM XT! The days of "computer wars" are over, because as soon as you brag that you have the "latest and greatest", 5 minutes later, someone else has something better than YOU have... and 5 minutes after that, someone else has something better than THEM! And so on and so forth.

No, what we must do is focus on comparing apples with apples (Atari computers vs. other Atari computers) within our own backyard (the Atari community). If Atari were to come out with a 500MHz PC that was uniquely "Atari" (fairly non-compatible with other PC's (if it's no different than another PC, what makes it stand out from being just another PC?) and

designed specifically to be, always and forever, an Atari computer (no installing other OS's on it allowed! If you wanna do that, buy yourself a generic PC, ya' Wintel heathen!) and we compare it to a 3GHz Pentium 4 PC someone else uses, it looks like we're idiots! Our computers are VASTLY slower and less powerful! There's no way we can hope to do what they can!

But, if we keep our eyes on the Atari computers of yesteryear... 16Mhz 68030 (Falcon)? Even 33MHz 68030 (TT)? Even the 50Mhz 68040 Milan's and Hades clones? We suddenly see how much BETTER and FASTER our new Atari computer is!

If we are to have any hope of giving Atari computing a chance at rebirth, we must swear our loyalties to it, not to compare to the outside world. Not to see it for how much less it is than other computers, but how much BETTER it is than the Atari computers that came before it!

If I had my choice of staying with my AMD Athlon XP 2000+ (1.7GHz true speed) system with 128Mb PC133 memory, 64Mb GeForce3 Ti200, and Windows 98SE... or buying a brand new Atari PC that was a mere 500Mhz, with an AGP 2x video graphics chipset (sharing up to 32Mb of system memory most probably), with a unique OS/GUI and a library of software (games and apps and utilities) that was slowly growing from one or two other Atari software divisions and the Atari community in general...

I'd sell my AMD PC to buy the Atari PC. No doubts. No questions. No hesitation. Right now. This instant!

It would be no different than that fateful day as I was reading a "Compute!" magazine in a Thrifty's Drug Store... I was an Apple IIc owner/user at the time... and I came across the first Atari 1040ST ad I'd ever seen (I'd already seen the 520ST ad months earlier and thought it was cool, but not so much better, that I just HAD to own one... afterall, it was only roughly better than the 512K "Fat Mac" of the day).

BAM! I said to myself, "That's mine!" and I instantly determined, in my heart, to sell my Apple IIc as soon as I graduated in '86. And I did (it sold quite quickly, too!). Shortly thereafter, I bought my 1040ST from a place called ComSoft in California. And I was happy...

I believe the only real expense in building a new "Atari PC" would be the case (I firmly believe that, if the very first models look no different than other PC's, no one is gonna notice or care that they're Ataris at all!) and the OS. I believe that the first new Ataris MUST be cased like the 1040ST/Falcon030. That is, in my own opinion, the most unique look that will guarantee recognition by anyone familiar with the ST series at all. Regardless how much they hate(d) it.

Only the few and far between, cave-dwelling idiots are gonna think it's no better than the ST(e)/Falcon030 that came in the same case. "If you don't read this ad, you won't want this computer!" Hey, that could be a cool, new slogan! It depicts the few that would just look at the picture of the computer and think it was the same thing as before... kinda a pointless thing to bring out such old technology after ALL these years, don'tcha

think? Surely, there must be a reason... and it's for the sake of instant visual recognition... not to mention a few other cool additions to make it stand out...

Man, here I go again... spending hours writing up ONE blasted reply! I wonder how many others I'll spend this kind of enthusiasm on... *sigh* I'm too dedicated to this dream... really, I must be.

Well, you know more about low level ST programming than
I ever knew. Your code looks pretty good to me.

I find it interesting that the ST was designed with that
interrupt in mind, yet they chose to do printing by
polling. Does that mean they never got it to work
properly?

I notice that it's the lowest priority MFP interrupt.
I wonder if higher priority interrupts interfere with it?

But *you* have control of the speed of the transfer. The sending
computer won't send if your computer is BUSY. Maybe you
could slow the transfer down a little?

I'll look at your code in more detail. I tried transfering data
between two STs in 1989 using a parallel cable.. I think I still
have the cable. I'm almost tempted to pull the old ST/e out
of it's box and experiment...

hehe.. Almost ;))

Steve.

Please correct me if I'm in error but I heard (somewhere) that the
Tremiels refused to pay for national advertising (if I'm not mistaken a
national ad for IBM is paid for by IBM). But wanted the dealers to bear the
cost which started lawsuits over unsold, inventory that relied on mostly
"word of mouth" in the music industry to sell (including the Jaguar which
was left on Walmart shelves).

Ermm. this Matrix card is *strange*

First of all. the driver reports that it is a Matrix Moco, when the board says Matrix Mico. When I use the 1280x960 mode the screen turns black and whala, no display. So I took the chip out of hte expansion board and plopped it in. The card decided it was a Matrix Coco with 256 colors, but 256K ram. the amount of RAM it is seing seems inaccurate as the Matrix Mico supposed to have 1MB by itself - with expansion it should be 2 or more.

There's a pin bent back that was soldered to on one of the chips. Anyone think this could be limiting ram on the Mico board?

Thanks
Mark

>I also would suggest it be a pci card and first be developed for the hades
>and milan, as they already have a pci bios for such things. Then if a
>functional driver ever came out of the project it could be adapted to other
>machines. It's already been proven you can hang an isa card off the rom
>port.

This is like trying to reinvent the wheel (why ain't I surprised). The PCI
bios only comes in play when one uses a PCI card. For the Atari platform
IMO a SCSI => USB adaptor would be the best bet. These are widely available
from several manufacturers, they cost a little more, but the advantage is
that users of a Falcon, TT, Hades and Milan (with SCSI card) can use them.
People using ST's and STE's possibly will be able to use the adaptor with
the Link97.
All (?) what's needed is someone developing a OHCI compatible master driver,
the device specific drivers (mass storage, printers, MIDI) can be supplied
with/when the appropriate software/hardware is released/updated.

>Before anyone has a tizzy, mint IS the most robust OS and open OS we have.
>It's the best point of entry, and the quickest point of entry into the world
>of USB.

If it's so open then why doesn't it come with a OHCI driver and USB support as
standard? Once again someone needs to reinvent the wheel because the OS lacks
the IMO necessary support. With the direct result that before we know it, there
will be several incompatible drivers floating around....

And before anyone has a tizzy <grin>, I'm not having a go at MiNT this time, I
really mean it. Support for USB should be part of the OS, just like support for
the serial, parallel or even joystick is considered a must. USB is not going to
go away. If the commercial and closed OS is updated I wouldn't expect anything
less. The advantage is that developers don't have to reinvent the wheel, and
that all the drivers will be compatible. The programmers will be kept busy at
writing specific drivers (printers, scanners, cd-rw, DSL etc).
If for once the developers of the open OS *and* the developer of the closed OS
follow the standard without adding bells and whistles, then these drivers
should work on both OS's.... even Microsoft and Apple managed not to screw it
up.

It's time we learn from our mistakes. The multitude of incompatible internet
stacks with their large number of incompatible clients was caused because the
open and closed OS *both* didn't support it. If they would have done, then we
would have had better clients now. Remember Opera not wanting to port the
browser because there's no universal stack on Atari?

Cheers from Belgium
Dennis

The MegaSTE runs at 8mhz cache disabled by default.
It's why it's 100% compatible with the STE if you boot a game on a floppy.

It just happens that you probably have GENERAL.CPX that set it active on gem
boot up

Dbug

Its not about the hardware though it would be nice if we could have a new
Atari PC maybe not based on 80x86 technology.
My viewpoint is that Atari is dead. Just like Elvis. Nothing will bring
it/him back and we just have to get over it and do our own thing.

Its necessary for the companies to harness the genuis that they have in thier staff and to bring out the best of them yes, but the saddest thing is that most of the suits are penpushers who are too scared about holding onto thier jobs to try anything new, and most new radical ideas get shelved because they are precisely that. It needs both kinds of people to get anywhere. The original atari people yes have mostly if not all moved on, that is why in another post I mentioned that "WE" are now the "ATARI PEOPLE", we are the dreamers and conceivers but we are not in any kind of position to do anything about it. Take Rodolphe Czuba for instance. He is one of those genius'. If you gave him a guaranteed salary for x years, a decent budget and a design idea, he would create something that we could all have an input in, that would be the answer to a new ATARI computer. Is it gonna happen? not unless one of us is rich and crazy enough...

newsgroup.
>

Maybe I do this at work? :-)

No actually I dont consider this spare time, what I have left over afterwards is my spare time.

Smeg.

Hi, Mark,

OH, I'm sure someone shomewhere is mad at you, isn't that the nature of the human race????
LOL

I was looking for a phrase like "Email Us" or "Contact Us" "Admin Messages" never rang a
bell as that is the same thing. Usually, when I've emailed a webmaster of the page, it
never was replied to, at least never with the answers I wanted.

Please check you email.

Nope, The MegaSTe runs at 16Mhz by default. The fact that you boot games
from floppies switches it to 8Mhz non-cached.

> It just happens that you probably have GENERAL.CPX that set it active on
gem

Nope, never touched it, it looks like you have though!.

LOL!!! There is no "right" way in a discussion like this. And besides, you've got the math wrong. Old Bill's worth about 40 billion the last I heard. 10% would be 4 billion, I said 10 times which is 400 billion. That's a lot of moola!

As much as I would like to see a new Atari, I won't buy a "significantly faster/better" computer. Why? It can't do what I want it to.

Do you remember the (what I believe is) the first attempt at multitasking on the Atari? It was called..... hmmmm, not sure now. Multi-View? It was from Pam Software, in Germany I think. It was cooperative multitasking, and had a couple of nasty bugs that were never solved. Programs would crash. I believe Dan Wilga of Gribnif found the problem with the code before he released Geneva. Revolver and Juggler do not count, they just swapped memory locations which is not the same.

When I got this program, I knew then that if all computers worked like this, the computer would be 10 times as useful to me. Why? Because I could use the computer in a similar manner than my mind works. When I'm sorking on Project A, I may very well suddenly have an idea about Project B that is probably totally unrelated. With multitasking, I can immediately switch to Project B, get the idea down right then and there, and go back to Project A. If I have to do single tasking, by the time I switch programs back and forth, I've lost the thought process (or whatever you want to call it) for both projects.

As a matter of fact, this just happened. I suddenly remembered something I needed to talk to my sister about, so popped over to the email program, wrote it, sent it off, and now I'm back.

So when Geneva came out, I put it on my TT and have been happy ever since.

But multitasking slows down operations. Not just because the OS is larger, but because of the increasing demands of each piece of software, things slow down. So faster and more powerful processors, and huge amounts of RAM become an absolute necessity. I've got Calamus Sl98 on my TT with 42 mb of RAM. I have Calamus Lite on this 400 mhz 128 mb Ram

Dell Win98. I never thought I'd ever say it, but I'll never use the TT again for that program except to create effects I cannot do in the Lite version.

And the software for what I now do on computers simply does not exist on the Atari, sadly. Here's some examples:

I chat all the time in the evenings. But all my friends and relatives use either Yahoo or AOL's Instant Messenger for this. I can't use either on an Atari.

I"m creating a database for my sister's church that they will maintain. They have MS Access. I don't know of a database program on the Atari that is truly relational and available anymore that can create a relational database that could be simply imported into Access and run. In the old days of dBase III in DOS, this platform had a program called dbMAN that was 100% compatible.

The same thing applies for work processing and spreadsheets. It's too bad that the writer of Texel refused to release the English translated version 2.3 for Texel as I was prepared to buy it.

I"ve been selling a lot of my ST/Tt stuff on Ebay. But I'll probably never sell the Hades or TT, or the software I keep for it. Nostalgia, I guess. Heck, I even have my old 800's and their software too.

The only thing out there software-wise that I might buy for the Atari now is the latest version of Papyrus, if it ever comes out in English. But at the same time, I'd probably try to cut a deal with ROM to get the Windows version at the same time for a packaged price.

If I ever get out of debt again (:-( ) I'd like to update the Hades to Magic/Linux/MiNT or something, but that's not going to happen in the near future. And truthfully, it probably never will.

> But, if we keep our eyes on the Atari computers of yesteryear... 16Mhz 68030
> (Falcon)? Even 33MHz 68030 (TT)? Even the 50Mhz 68040 Milan's and Hades
> clones? We suddenly see how much BETTER and FASTER our new Atari computer
> is!

The Tt is 32 mhz. My Hades is overclocked to 60 mhz. But that is still not fast enough to multitask a modern application at an acceptable speed, unless you are having a race to watch paint dry and grass grow.

> If we are to have any hope of giving Atari computing a chance at rebirth, we

> is than the Atari computers that came before it!

It's like the owners of Funny Cide, the race horse. One of them said "We may be hicks from the sticks, but we are not stupid." When it comes to using computers, I'm not going backwards to a slower computer just to us my Atari. An exception to this would be surfing, newsgroups, and email if it can keep up. At least that way, the virus writers could go to H*** as their crap wouldn't infect the machine. Right now I'm migrating to an old Power Mac 6500 for these things just to put a crimp in the virus writers style. :-)

But don't you see here? The 1040 was an -IMPROVEMENT- over what you had and you just had to have one. You jumped ship to the Atari. You're current desire does not match the original reason you bought an Atari.

> I believe the only real expense in building a new "Atari PC" would be the

> Regardless how much they hate(d) it.

While the old cases are neat from the standpoint of visual artistry, they absolutely will not work. No room for expansion of any kind, and who wants a mass of cables running all over the place any more? Look how much extra space all the external peripherals take up!!!

AFAIK, Motorola is no longer making the 68XXX line of processors. So a new motherboard design is necessary, a rewritten OS, and all software would have to be rewritten to some extent. Having played with the emulator idea, you need even faster hardware to make the old stuff seem as fast. Mac has essentially built this idea into OSX so it could run OS9 programs.

I"ve often wondered what was in TOS 5. I had one software writer tell me on the phone that it was pretty neat as he'd seen a copy of it. And Scott Sander's Atari Compendium covers TOS 5 as well.

> Man, here I go again... spending hours writing up ONE blasted reply! I

My dream? To be an engineer on the massive steam locomotives of the late 40's and early 50's. Now, -THERE'S- horsepower! The Union Pacific's Big Boy is absolutely montrously huge!!

I would disagree, because there are some mistakes that are made over and over and over again. Regardless of how times change, some things never do. You can identify those and then not repeat.

Generally agreed. You have to remember, in a corporation, even the CEO's have to answer to the boss. The boss is the shareholders. In you job, do you go and just do what you want when you think it's right? An in the case of Rodolphe, if you gave him a salary, you are going to A) put a number in for x years and B) expect to see an end result at the end of those x years.

Thats true, but ironic. Most people can get thier PC on the net quite
easily, but today I decided to set up sting/newsie/cab on my
Falcon.....hahaha. Ok, only took an hour to get sting connecting due to me
not seeing my misspelt username....duh! then getting newsie to actually
access this NG and send mail.... more problems. 3 hours later and I have CAB
2.8 running (in German) and its not working....

Oh I guess you meant for wordprocessing? :-)

I agree with you to a point, though the computer market still is extremely
dynamic. The biggest mistake that Sam Tramiel made was having that stupid
rug moustache. It just said "dont trust me I'm dodgy" :-)

We know enough about Rodolphe and his previous projects to know we WOULD
have a result. Of that I would put my own money on (If I had any).

Smeg.

>Well, you know more about low level ST programming than
>I ever knew.

I know a little bit, although nowhere near as much as the demo coders
do/did. Most of what I know is from looking at the documentation to see
how it's supposed to work, or from writing stuff that falls over and
then fixing it. And this is just another example of writing stuff that
falls over and is slowly getting fixed :/

>Your code looks pretty good to me.

And I thought it looked a bit like spaghetti :)

>I find it interesting that the ST was designed with that
>interrupt in mind, yet they chose to do printing by
>polling. Does that mean they never got it to work
>properly?

I don't know. After a cursory look through the TOS source in "Internals"
I didn't see anywhere where the interrupt was used. It could be they had
planned to use it as some form of control but never actually implemented
it. It could be useful for controlling a printer spooler. Since the
interrupt is edge triggered, it would need to be toggled between the two
triggers to work, not that it'd take more than a few instructions.

>I notice that it's the lowest priority MFP interrupt.
>I wonder if higher priority interrupts interfere with it?

I'm not sure how they could since the first thing I do is to disable
interrupts. However, while debugging/testing, TOS does seem to think
some of the received bytes were key presses. I'm not sure if this is
something to do with MonST or the MFP/TOS getting confused and mixing up
the data.

>> I don't get it all and I

>could slow the transfer down a little?

I was being a bit idle and just using "ls >/dev/lp0" in an empty
directory to send a small amount of data. I suppose I aught to write a
little something to send a text file slowly.

I think I'll write a specific app to read the port first, and then go
back to getting the more generic one, buffering the port, working.

Yeah guys,

My MSTe starts in 8MHz no cache.. I'm quite sure of it.. it's slow until
the fast.prg runs.

So explain me why I have to add a small "FAST.PRG" program in first place in
the Auto folder if I want to speed up the boot sequence if the machine is
already running at fast speed ?

Dbug

A lotta moola you don't need... a willingness to revive the Atari name for computing is what you need. Would you be willing to own a 500MHz Atari PC for $500? I would. The case and OS (actually GUI) are all you really need to spend money on, the all-in-one motherboard and onboard CPU already exist.

> As much as I would like to see a new Atari, I won't buy a "significantly
faster/better"
> computer. Why? It can't do what I want it to.

All new things take time to grow. Where do you think the Atari platform started? 100 apps or 10? I remember a time when the shelves of Comsoft were pretty sparse right at the beginning. But they filled up quickly enough with scads of software... games, utilities, and applications!

The new Atari PC would be no different. The only difference is you won't see the software on shelves, you'll buy them online. Shelf space only exists for Windows programs and the companies that can afford it. Even Linux and it's ilk can't get but a slot or two on a shelf these days, and foreget about Macintosh apps... unless it's a hybrid CD, it won't see the time of day there either!

Will you see MS Word for the new Atari? No. Will you see WordPerfect? No. But you could see apps that read/write those format, just like you do on BeOS...

The OS I'm thinking of already multitasks. It's a unix-like clone. Not Linux (or one of it's billion of offshoots). Not NetBSD (or OpenBSD or FreeBSD). Not SkyOS. Not TriangleOS. Just a little, obsure OS that no one thinks much about anymore. You know, kinda like TOS/GEM. Word has it, TOS was actually a variation of CP/M-68K. Is that true? GEM was just the window dressing over it...

> But multitasking slows down operations. Not just because the OS is larger, but because of

> Dell Win98. I never thought I'd ever say it, but I'll never use the TT again for that
> program except to create effects I cannot do in the Lite version.

Multitasking doesn't slow down operations. Software bloat slows down operations. The more resource-hungry an OS is, the slower it runs on lesser hardware. Never heard of Microsoft Windows?

I'd be willing to bet, MHz for MHz, Calamus on your TT runs faster that the Lite version does in Windows 98. Why? The OS itself is more efficient on resources (shoot, it's stuffed all into ROM, if nothing else!) If you assume the TT ran at 40MHz (which we know it doesn't), your PC is only a mere 10X FASTER... gee, think you'd notice a difference with that kind of leverage? Naw! :-)

But if your TT ran at 400MHz? You'd never even THINK of owning the PC version! Well, the bottom-line Atari PC I'm thinking about is 100Mhz faster than that! So...

> And the software for what I now do on computers simply does not exist on the Atari, sadly.
> Here's some examples:
>
> I chat all the time in the evenings. But all my friends and relatives use either Yahoo or
> AOL's Instant Messenger for this. I can't use either on an Atari.

BeAIM exists for BeOS. Works very well, too. Shouldn't take much to create an Atari version...

> I"m creating a database for my sister's church that they will maintain. They have MS

> available anymore that can create a relational database that could be simply imported into
> Access and run. In the old days of dBase III in DOS, this platform had a program called

> dbMAN that was 100% compatible.

Maybe the source code to a dbMAN or dBase III clone exists that could be ported to the new Atari...

> The same thing applies for work processing and spreadsheets. It's too bad that the writer
> of Texel refused to release the English translated version 2.3 for Texel as I was prepared
> to buy it.

See above for apps that might read/write MSWord/WordPerfect formats...

> or TT, or the software I keep for it. Nostalgia, I guess. Heck, I even have my old 800's
> and their software too.

Atari Nostalgia is for people who can't go back to "the good ol' days" (which we can't presently). If I have my say so, nostalgia will be simply a part of the past that lives on today. It will be remembering the past while enjoying the present. Nostalgia won't have the painful sting it does today.

Atari 800? What on earth are those good for today, except to collect dust and make fun of? An Atari 130XE would be taken more seriously...

> The only thing out there software-wise that I might buy for the Atari now is the latest
> version of Papyrus, if it ever comes out in English. But at the same time, I'd probably
> try to cut a deal with ROM to get the Windows version at the same time for a packaged
> price.

New Atari... more reason/liklihood to port Papyrus to it. No new Atari... Papyrus goes bye-bye. Which would you prefer?

> The Tt is 32 mhz. My Hades is overclocked to 60 mhz. But that is still not fast enough
> to multitask a modern application at an acceptable speed, unless you are having a race to
> watch paint dry and grass grow.

Bottom line... New Atari PC running at 500MHz... Wanna watch paint dry? Do it waiting for your TT to do something. Wanna watch grass grow? Do it on your Hades. Ain't gonna have the time to do that on your new Atari. Shame, isn't it?

> It's like the owners of Funny Cide, the race horse. One of them said "We may be hicks

> surfing, newsgroups, and email if it can keep up. At least that way, the virus writers
> could go to H*** as their crap wouldn't infect the machine. Right now I'm migrating to an
> old Power Mac 6500 for these things just to put a crimp in the virus writers style. :-)

You sound like one of those that uses faster and better computers just because they're faster and better. Name doesn't matter. Bloated OS doesn't matter. Just MHz. You'd probably never be happy with the new Atari PC. Optimized OS be (!!!). If the system is slower than another, you don't want it.

Why do you think virus writers don't pay much (any?) attention to BeOS? It's too obscure and off the beaten path. It's not used by everyone. You can't create chaos if there aren't a lot of people to stir up. The Mac, Atari, BeOS marketshare allows this to be possible. Make Macs or Ataris or BeOS as vastly used as Windows on a PC... and the viruses WILL follow.

You wanna be popular with lots of viruses or have few (no) viruses and a lack of popularity? Can't have your cake and eat it too, sorry. Virus writers only go after the popular majority. I'm fairly certain a new Atari PC would be safe from viruses, one way or another.

> > I'd sell my AMD PC to buy the Atari PC. No doubts. No questions. No
> > hesitation. Right now. This instant!
>
> But wasn't this the idea behinde Hades/Medusa/Milan also? And where are they?

What they tried is to create an Atari CLONE. Based on a DEAD platform (remember... Atari (as a hardware company) was dead and still is). Cloning a dead platform is like trying to clone a dead sheep (let's name her "Deddie")! You might have two of them, but... who cares? A faster version of a dead horse is still a dead horse, to put it another way...

Death does not beget life. Life (hope/dreams/vision, etc.) can resurrect the dead, however. Jesus resurrected Lazarus from the tomb, not the other way around, to put a biblical spin on it.

> But don't you see here? The 1040 was an -IMPROVEMENT- over what you had and you just had
> to have one. You jumped ship to the Atari. You're current desire does not match the
> original reason you bought an Atari.

In today's technologic treadmill, you can't hope to keep up with the big boys, because the big boys are all there is. You don't exist. Make a PC that has the latest greatest components? Someone can build it, too. And 5 minutes later, theirs will be better. It's a friggin' rat race. Speed for speed sake. Hobble a 3Ghz processor and 256Mb of RAM with Window 2000 or XP... and it might as well be a 500Mhz computer! OS efficiency is a big

part of effective CPU/memory usage.

Picture a 1040ST running at 500MHz or 1Ghz with 256Mb of RAM... now how awesome would THAT be! Now add in an AGP 2x 3D-accelerated video subsystem! Wow! But a Windows system with those specs? *Yawn*... boring!

In the Atari relam, we need to keep our eyes lower and focus on our own interests and goals. to me, *enjoying* a computer is half the importance as how much and how fast it can do. Meaning, if I don't *enjoy* using the computer,. it becomes a purely functional tool to get something done. That's what windows 98 SE is for me. Purely functional, very little fun.

Why do you think MacOS X is as different and snazzy looking as it is, today? Because Apple wants to put FUN back into geting things DONE (rhyme intended). [Ooh, a new slogan!] You enjoy using the OS. You use the OS to get work/things done. That's what the ST was way back when. Sure, an Amiga was better, but I hated the OS (it looked rediculously primitive and amature, compared to GEM). The OS was better. The hardware was better. But I hated the look and feel. Who cares what it could do (and how much better it could do it), if I disn't like using it, it didn't matter!

Do you realize that, to this day, I love grey more than any other color? Why? Because of the Atari 1040ST. I never liked grey before that. Never cared about it. But now? Grey T-shirts. Grey pants. Grey paint... grey hair... oops... I think I'm going overboard... :-)

If look and feel (OS and case) and name and history ("Atari") don't affect your desires for a computer, then speed and functionality is all there is, and a PC with Windows is the only place you will get it en mass.

> While the old cases are neat from the standpoint of visual artistry, they absolutely will
> not work. No room for expansion of any kind, and who wants a mass of cables running all
> over the place any more? Look how much extra space all the external peripherals take
> up!!!

Ever seen a MicroITX motherboard? 6.5" x 6.5" square and less than 3" tall at the ports in back. You can't tell me that a motherboard of those dimensions won't fit into a 1040ST. If the measurements of a 1040ST from one site I've read are accurate, the ST, in back, is 2.8" tall (round up to 3" just to make it easy). Think of what you can do with all the space left inside the rest of the case... and most of the ITX motherboards have audio and video aready built-in!

Wanna see what crazy things people are doing with their microITX mtoherboards? Go here...

http://www.mini-itx.com/

They've stuck them into Humidores, Commodore 64's (which is where I suddenly realized exactly how possible it would be to put one into a 1040ST case),

Star Wars Millenuim Falcon models, Sega Dreamcasts... even picture frames! It's utterly mind-boggling!

> AFAIK, Motorola is no longer making the 68XXX line of processors. So a new motherboard
> design is necessary, a rewritten OS, and all software would have to be rewritten to some

> old stuff seem as fast. Mac has essentially built this idea into OSX so it could run OS9
> programs.

There's this emulator called STonX (pronounced "Stones", since X sound like Z, in some cases, like Xevious (Zevious))? or just pronounced as "ST on X"?)... If X11 is used for the OS... we might have a very interesting combination, hmm?

> I"ve often wondered what was in TOS 5. I had one software writer tell me on the phone
> that it was pretty neat as he'd seen a copy of it. And Scott Sander's Atari Compendium
> covers TOS 5 as well.

The past is dead. Non-existant. Unimportant. Irrelevant. TOS 5 might as well be Windows 1.0, for all the current event usage it's worth.

> My dream? To be an engineer on the massive steam locomotives of the late 40's and early
> 50's. Now, -THERE'S- horsepower! The Union Pacific's Big Boy is absolutely montrously

Same here. My Falcon has never had a color splash screen at boot up. Perhaps ICD allows some graphics mode setting *after* the initial boot process has begun? I'll have to pull out my old ICD disks and experiment.

Personally, just for kicks, I'd love to have a 640x480 in 256 colors boot-up splash screen with Magic.

For information, runing the MSTE at 16mhz without the cache is absolutely useless.
With the cache on, the machine is nearly twice as fast as an STE while you don't access I/O ports, but when the cache is disabled all memory access (including reading 68000 code) is done at 8mhz, so the only speed gain you get is from the fact the execution time of instructions is reduced. But in practice it's nearly nothing, perhaps 10% of maximal gain.

I don't see why Atari would have sacrified the compatibility of the system by activating the 16mhz mode without offering the speed of the cached mode :(

Weird.
Is it possible that Tos 2.05 and Tos 2.06 machines behave differently at boot up on this particular point ?

I read quite a bit on this as to how some 16MHz upgrades for ST's are
better than others. Surely I thought they worked out a cache free work
aroud for the mega ste. I apparently was wrong in that thought. But yes
if the Mega ste is like an accelerated STe, the cache makes all the
difference.

If I remember correctly, the ICD HDUTIL program has an advanced tab
where you can choose the computer you have and what video
resolution you wish to boot. Perhaps this is something that could be
added to HD-Driver? I'm sure it's design (HD-Driver) is for speed.
My falcon boots much quicker with HD-Driver, especially if I set
the Falcon NVRAM to two colors, and use a small, 2 color boot splash
img file for MagiC.

Bonjour :)

Download at http://rajah.atari.org or directly at
http://membres.lycos.fr/nef/files/ -> manga_uk.zip (470 Kb)

News :
- shuffle mode
- best times
- monochrome images supported (already manages 16 and 256 colors)
- utilz to make your own set of images (use M&E Parx modules)

This may be the last and only update for this game, I must
work on Cresus.

Have Fun :)

Rajah Lone/Renaissance and Cooper/Paradize

But thats not what we are discussing, either way, 16Mhz non-cache is still faster than 8Mhz

> With the cache on, the machine is nearly twice as fast as an STE

With the cache off its twice as fast, with the cache on it up to 10 times faster

> while you don't access I/O ports, but when the cache is disabled all
> memory access (including reading 68000 code) is done at 8mhz,

Where did you get this inforation, this certainly conflicts with my ideas?

> cached mode :(

I think it was for compatability during boot, but some hard disk drivers (eg ICD) for instance switch to full throttle to complete the boot process

> Weird. Is it possible that Tos 2.05 and Tos 2.06 machines behave
differently
> at boot up on this particular point ?

That's quite possible, as i've said, i have non of this fast.prg stuff, and i am well aware of boot speed and cache settings, i did extensive research on add on processor boards and wrote a number of utilities to switch various cache modes, my MegaSte boots at 40Mhz with cache on due to my custom floppy boot sector switcher. Well i'm working from memory mostly, my MegaSTe has a custom 32 bit TOS 3.06 anyway.

Mark,

I just want to be able to have all , er, or almost all variation of
Toad Catalogs so I can scan them and archive them online for everyone
else to be able to view! Plus, it does make for a good reference.. but
I haven't seen anywhere you can view the complete catalog online.

I didn't say the contrary.
I just say that a 10% speed increase is not enough to justify it.

> > With the cache on, the machine is nearly twice as fast as an STE
>
> With the cache off its twice as fast, with the cache on it up to 10 times

Without offence, could you tell me what kind of weed you are smoking ???
What you are saying basically, is that when the cache is activate the
MegaSTE is more than two times faster than a non accelerated falcon !

A 16mhz 68000 that can access the memory at 16mhz is two times faster than a
8mhz that can access the memory at 8mhz.
Point.

And in the case of MegaSTE we are in this 16/16 configuration only when the
processor is working in the cache memory.

> > while you don't access I/O ports, but when the cache is disabled all

Simple programing experimentation.

So you cannot guarantee that the MegaSTE and it's ROM is doing this. It
could be a side effect of the fact your hard drive driver eventually switch
the machine speed. Not at all what we were speaking about.
You should eventually unplung the HDD, and boot on a floppy without anything
in the autofolder and no desk accessory, and then run a benchmark. I'm
nearly certain that it will show the exact same CPU scores than a normal

STE.

Several ways:

Easy:

Nullmodem cable and zmodem transfer.

Complicated if you don't have a working tcp/ip network already:

1. Ftp with ftpserver and Aftp
2. Http with Weblight and CAB
3. Bnet that gives you "shared drives"

Fast:

PARCP using parallel port. I believe this is slightly faster even
compared to two TT:s connected by Ethernet.

There are other ways to get a MSTe to run _after boottime_ than
FAST.PRG...

Just tested here with TOS 2.06 booting from an empty floppy and Sysinfo
gives 8 MHz. Quite simple to go on from there and add more startup
"features" until Sysinfo tells the computer runs at 16 MHz. Any MSTe
owner can do that...

Time to put you back to my killfilter... Your post are mostly abusive and
when you try(?) to behave civilized and add to the group nothing of any
importance comes out...

Steve, can you explain your hardware a little more, how have you
achieved the 40mhz, I'm not familiar with the innards of a mega ste,
but if there is some capability to boost the speed of it upto what
you've got, I may look at one of those, as opposed to hunting for a
TT.

Rob

news:6HXzeeF0oi4+Ewn+@my-ste.demon.co.uk...

> >Your code looks pretty good to me.
>
> And I thought it looked a bit like spaghetti :)

hehe.. Well.. That's assembler, eh? Actually, I meant that
you understand the hardware better than I did when I was
programming the ST. I'd love to go back in time... I'd be
a hero... *cough*.. well.. maybe...

I found the schematics of the ST/e on the web.. Amazing.
Neither BUSY nor STROBE is inverted, which means
that they follow the centronics standard, which is, BUSY
is active high, and STROBE is active low.

Programming a PC is screwing with my brain... *sigh*

I've looked at your code, and I've read some Atari
books which I have, and I have a few comments to
make which may or may not be helpful.

1: Ports A and B of the PSG are bidirectional,
but the direction has to be set before reading or
writing to them. Port B is the printer data port.
Since it's normally an output port, maybe it should
be set to input (Once only, perhaps...)

Write 7 to $FFFF8800 to select the mixer register
AND $fe to $FFFF8802 to set port B to input

2: It's not clear to me whether port B should be read
from $FFFF8800 or $FFFF8802. From what I've read,
it seems that either should work once the register is
selected by writing 15 to $FFFF800. Do you know?

Or perhaps XBIOS functions 28, 29, and 30 should
be used for this stuff.

3: The following lines appear in your handle_int function:-

```
bset.b #7,$fffffa0f.w
bclr.b #7,$fffffa0f.w
```

You are setting then clearing the 'interrupt in service' bit
for the monochrome monitor detect interrupt. Why?

```
4: move.b d0,4(a5,d7) * write byte into buffer

It might be worth checking your assembler docs
regarding the n(An,Dn) effective address mode.
According to my 68K assembler book, it can be
either n(An,Dn.w) or n(An,Dn.L).

If the D reg is word sized, then it's sign extended
during the address calculation. I think that would
have a rather devastating effect on the 32k of memory
that sits ahead of your data buffer, once the head of
the buffer incremented past 32767.

5: Is this just to take up a little time?

clr d0
.loop
dbra d0,.loop

6: I don't understand your the_bits function.
Are you sure the right values end up in the right
places? Consider the_bits being called from
set_strobe_low.

set_strobe_low
lea strobe_flag(pc),a0 strobe_flag -> a0
clr (a0) clear strobe flag
moveq.l #$df,d2 D2 = $df Mask to lower STROBE?
movem.l d0-2,-(sp)
move sr,-(sp)
or #$700,sr
move #$0e,d1 D1 = $000e
move.l d2,-(sp)
bsr.s the_bits call the_bits
move.l (sp)+,d2
and.l d2,d0
moveq.l #$8e,d1
bsr.s the_bits
move (sp)+,sr
movem.l (sp)+,d0-2
rts

So, D1 = $e, and D2 = $df

the_bits
movem.l d1-2/a0,-(sp)
lea $FFFF8800.w,a0 PSG control register -> a0
move.l d1,d2 D2 = ????000e STROBE mask is overwritten
and.b #$0f,d1 D1 = ????000e
move.b d1,(a0) select PSG register 14 (Port A)
asl.b #1,d2 D2 = 000C
bcc.s .read and carry bit is set so...
move.b d0,2(a0) write d0 to port A.
```

```
What are the contents of D0 ???
Did I miss something?
.read
clr.l d0
move.b (a0),d0 D0 = Port A bits
movem.l (sp)+,d1-2/a0
rts
```

Steve.

I'm working on a research project to prove that people were sending compressed video files over networks prior to 1991. I used to have an Atari 1040ST & I could swear that we were doing that sort of thing (although primatively) back in the late 1980s. Can any of you give me actual examples?

Kenneth,

Oh I'm not sure about that. My TT does at least 250K/sec with
Magxnet/MiNT on an ethernec. Of course I am also using ozk's super
whizbang much faster driver too. I don't recall pricisely what parcp
could do but if I recalled it doing 250+K/sec I *never* would have
bothered with ethernet.

Thanks,
Mark

Thanks for having tested. That's enough for me :)
It seems that now a majority of person agree with the fact that a normal non
modified MegaSTE boots up at 8mhz.

I will not continue talking about that, except if someone (like mister Steve
Sweet) manage to prouve that a normal non modified MegaSTE boots uo at
16mhz.

Actually, an English translation of Texel 2.20 (not 2.3) is
available as a patch from the DDP Translations web page. You need
the German original program, which is then patched to English;
other English replacement files are also supplied.

Regards, /Peter/

silly question maybe, but do you define a BBS as a network ?

I was sending/receiving compressed files over the phone lines in
that time period. I was mainly using BBS's and Genie. I am not
sure if that is what you mean though.

I was reading articles on the Internet and found a short one that mentioned that the new Atari Inc. sold over 1 million copies of their new Matrix video game. Sounds like maybe changing their name to Atari worked. Hopefully we will see some support in the near or distance future.

That is why I never got rid of my ST and STe. I still have all of
my ST games. Infact, I have alot of Atari 8-bit games as well as
my old 400, 800XL and 130XE. I just could not see getting of rid
of anything that gave me so much enjoyment just because bigger and
better machines showed up on the market.

I kind of agree with you. I have and use a Hades060 as my main
computer, but have a STe system right next to it. As far as being
ST compatible, the Hades runs alot of programs that the ST/STe
computers run, but this does not include many games. If you want
to know my opinion, I would say the Falcon series of computers are
the best ST compatible systems. The Falcon will run most ST
programs and that includes alot of ST games.

As far as I know, there is none. On my Hades, the Magic boot
screen has always been in b/w. I think that may be a function of
the graphics card/drivers but I am not 100% sure.

Having also tested two Mega STEs I concur. Use Xcontrol and the general CPX
to set the speed and cache. Use NVDI 2.5 with Cubase.

Note some TOS 2.05 machines may be different, all the Mega STEs I supply are
always fitted with TOS 2.06

Yes, this is what I mean, but I need a specific example of compressed video files being sent over a network such as a BBS prior to 1991. I really appreciate everyone's help here as it could really help the market continue to innovate VoD and streaming applications without fear of patent infringement litigation. What we are specifically looking for is actual examples of "prior art" or use of compressing video, storing the file, and then sending it to another machine via a network for viewing. It doesn't have to be an example of Atari (although that would be cool for this purpose as it would probably make the news in some form or fashion). Amigas / Macintosh (Hypercard), etc. are other potential sources of this prior art.

How do you figure that? Dont you think that the Matrix video game would sell
a million anyway, considering it was half-reasonable and it came out right
about the time, lets see, yes, when the *movie* came out?????

Thanks for the info. I double checked the STE's original supply and it has
two +5, three GND, and one +12. When I check the voltages of the new AT PSU
when connected to the STE mainboard the meter doesn't even twitch on the

+12, and showed about +2 volts when checking the +5s.

Nicholas

Perhaps you should approach Toad and ask their permission for this, its not up to you to decide this info should be publicly available. I'm sure if they are in agreement that they would provide the source.

Its got a PAK card in it along with a FRAK card, gives me an 68030 proccessor with a custom 32bit TOS, an FPU and 4 meg ST + 16Meg TT RAM, you'd be lucky to find one, even luckier to be able to afford it!!.. Ive also got an MV300 Graphics card and a SCSI 2 adaptor.

> enough with scads of software... games, utilities, and applications!

Absolutely not. There is no value for -MY-dollar spent here. When the Atari started, very few apps. But there were very few apps for the competition also. Everyone was on similar footing. To run the existing apps, you'd have to have either the existing OS or an emulator. And obviously, there aren't people willing to buy a new computer with no useable software for a new computer OS, and then sit and wait for software that -MIGHT- get written. Atari tried that years ago. They had a working CD Rom drive but wouldn't build and release it because there were no CD's out there for it. Well, no one was willing to write CD's for hardware that -MIGHT- exist. But the PC world did, and Atari's chance at being a leader in having CD capability went out the window.

It is not the same world as it was when computers were new and different and strange and.... Consumers, including me, expect more for their dollar.

> window dressing over it...

I suppose you could stretch a point and say TOS is a variation of CP/M. It was actually pretty much a rip off of DOS. And DOS was based a lot on CP/M. The GEM interface wasn't written by Atari either. It was written by Digital Research. They also had a version of GEM for DOS also. It was very much Mac looking and working originally, but Apple sued them and forced them to make it very simple looking and unappealing. Worked a lot like our TOS 1.0. I used to own a copy of it, GEM/3. And I had a copy of Gem Artline, which was exactly like using Easy Draw, except that Artline had the ability to a vector object

or group onto an irregularly shaped grid. DA's Vektor called this "transformation", Calamus and Outline Art had a different name for the same feature, but CRS prevents me from remembering the term. CRS= Can't Remember S**t. LOL

> Multitasking doesn't slow down operations. Software bloat slows down
> operations. The more resource-hungry an OS is, the slower it runs on lesser
> hardware. Never heard of Microsoft Windows?

Cooperative multi tasking doesn't that much, but true preemptive multitasking does? Why? Because in cooperative multitasking, such as Geneva, you can stop other program's processes from running, they are just sitting there dead in their tracks taking up RAM. Preemptive multitasking, on the other hand, can't do that. Those other programs and their processes are always running, and the computer spends time doing those tasks as well as the ones you are currently asking it too. Ever notice how things slow down when you have background printing turn on in a program? While that print process goes on, your program's other operations slow down. That's multitasking, my friend.

No way in H**L are you correct. Good thing you're as broke as I am, I'd own everything you have. And I run it on a 400 MHz Dell. Only the Gods have a clue as to how fast it would run on this 2.3 GHz eMachine I just purchased. And the TT runs in monochrome (8-bit color), the Dell and eMachine run in 24 and 32 bit color respectively.

> But if your TT ran at 400MHz? You'd never even THINK of owning the PC
> version! Well, the bottom-line Atari PC I'm thinking about is 100Mhz faster

But it doesn't. :-(And if it did, you wouldn't be talking about 500 MHz machine. :-)

> BeAIM exists for BeOS. Works very well, too. Shouldn't take much to create
> an Atari version...

Is BeAIM up to the same abilities as the Windows version? It's a curiosity question on my part.

Either way, you would have to convince AOL to let that happen. How would you do that?

> Maybe the source code to a dbMAN or dBase III clone exists that could be
> ported to the new Atari...

VersaSoft wrote dbMAN for both the Atari and DOS. Based on the list of trademarks listed, there may also have been a version for the Amiga. I owned the Atari version. It's 100% command line based like dBase III, with zero graphics ability. No graphics ability is unacceptable to users in today's world, IMO.

> See above for apps that might read/write MSWord/WordPerfect formats...

Papyrus has some Word compatibility. They claimed Word 97. But where it currenlty stands I don't know. I do know that in Papyrus 8's demo, it didn't work on a single Word 97 document I wanted to import. And right now Word 97 is 2 versions old.

So what? People have classic and antigue cars for exactly the same reason. Not a thing wrong with it as far as I can see.

> Atari 800? What on earth are those good for today, except to collect dust
> and make fun of? An Atari 130XE would be taken more seriously...

I have to say, I really liked that 800 keyboard feel.

> New Atari... more reason/liklihood to port Papyrus to it. No new Atari...
> Papyrus goes bye-bye. Which would you prefer?

Obviously, the 2nd part! :-) But as I noted earlier, I'm not buying a new Atari in the hopes that R.O.M. may port it. There would have to be some money to made for them to do it, and if your vision is that only existing Atari users would be purchasing a new machine, I wouldn't bet my life on the port if I were you.

> Bottom line... New Atari PC running at 500MHz... Wanna watch paint dry? Do
> it waiting for your TT to do something. Wanna watch grass grow? Do it on
> your Hades. Ain't gonna have the time to do that on your new Atari. Shame,
> isn't it?

Shame, yes. But it will never happen on a new Atari either. I don't believe there are enough subscribers to your vision for to ever happen.

> You sound like one of those that uses faster and better computers just
> because they're faster and better. Name doesn't matter. Bloated OS doesn't
> matter. Just MHz. You'd probably never be happy with the new Atari PC.
> Optimized OS be (!!!). If the system is slower than another, you don't want
> it.

Unless it can do equal or more than I can do now with -ANY- computer, you are correct. To buy it because it says Atari on it is no different than only buying a Ford. Doesn't matter if the Honda or Chevrolet or Kia can do it better, it's got to be a Ford or nothing. I don't subscribe to that "locked in" thinking process any more. I used to when it came to computers, but the need for me to be able to interact and exchange files with computer users of other platforms forced me out of that mindset. I wanted to make a living with a computer in desktop publishing, and that meant I needed to own and use PC programs. When I discovered the power of the software on the other platforms, I knew then

that any practical future for the Atari platform was dead.

> You wanna be popular with lots of viruses or have few (no) viruses and a
> lack of popularity? Can't have your cake and eat it too, sorry. Virus
> writers only go after the popular majority. I'm fairly certain a new Atari
> PC would be safe from viruses, one way or another.

If you keep the OS on a chip that can't be modified, you put a dent in a lot of virus writer's abilities. They can't modify the OS, like they used to do to COMMAND.COM on the PC. If M$ would take the Visual Basic abilities out of M$ Office, another virus writer's target would go away. Or at least a big chunk of it.

> In today's technologic treadmill, you can't hope to keep up with the big

> XP... and it might as well be a 500Mhz computer! OS efficiency is a big
> part of effective CPU/memory usage.

How fast is your AMD you mentioned. Because if it is reasonably old, I'd suggest you get familiar XP on a 2+ GHz machine. It's a different ballgame I'm finding out. I have a 2.3 Dell with XP at work. But I wasn't happy with 2000.

> inside the rest of the case... and most of the ITX motherboards have audio
> and video aready built-in!

I'm not talking about the motherboard. I'm talking about all the potetial add in cards for things not supported on the motherboard. Are you planning on USB? That would help in this area.

> There's this emulator called STonX (pronounced "Stones", since X sound like

But any emulator runs on an existing OS, correct??? Not the same as being the native OS.

> The past is dead. Non-existant. Unimportant. Irrelevant. TOS 5 might as
> well be Windows 1.0, for all the current event usage it's worth.

That conversation was 10 years ago, when Atari was putting computers on hold. Besides, TOS 2.x is probably better than Windows 1.0.

> And I thought *I* was being nostalgic, wanting to just go back to the late
> 80's and relive my 1040ST days all over again...

I'm a wrench bender at heart, not a computer engineer. I want these silicon boxes to work, I don't want to hack them or the software. Besides, in a steam engine, none of the "work" is done by magical electricity you can't see in that wire. :-)

Ken

so you want actual examples with dates and times of sending/receiveing
compressed video files via net or BBS back yonder..

can't you just check to see what BBS's were around then and maybe still are
and ask them what they had available to download ?

Atari's computers were the ONLY thing that Atari ever made. Their monitors were other brands with their case put on it. Their drives were other brands with their case on it. Their modem (SX212)... I dunno... I assume the same. Their printer was, I beleive an epson with their case on it. So, they never made their own working CD-ROM drive either... it was someone elses... and I recall hearing about it, maybe even seeing it at an Atari Faire in Glendale, CA.

> It is not the same world as it was when computers were new and different
and strange
> and.... Consumers, including me, expect more for their dollar.

True enough... but wouldn't it still be kinda fun to see Atari making computer again, even if they weren't the top of the line? I sure would. To me, owning an Atari computer is half fun and half to get stuff done. I don't like using a computer I can't enjoy using or like looking at... ah, to own an Atari 1040ST-styled Atari computer running at the same speed my Athlon XP 2000+ computer runs at... now THAT would be FUN!

> Cooperative multi tasking doesn't that much, but true preemptive

taking up RAM.

So, you take up precious RAM and get nothing done in/with the application you've just halted, while you do something else a bit faster in the main application. Now, how is that much different than a normal 1040ST where you open one app at a time to get something done, one... thing... at... a... time? :-)

Try downloading a file online while using your word processor in your previous example. Oh, I'm sorry... you'll have to WAIT to resume downloading your file, while you type up a letter to Aunt Mimi! Uh, no thank you... not for me.

> color), the Dell and eMachine run in 24 and 32 bit color respectively.

Hello? I said MHz for MHz. I believe, that if your TT ran as fast as your PC does, your TT would be faster, because the OS is more optimized and efficient, therefore, allowing things to happen slightly quicker. I don't exactly see Windows 98 fitting into 192K of ROM space, do you?
BWA-HA-HA-HA! Oh, that's rich! Gotta pick myself up off the floor with that one! :-D

> > But if your TT ran at 400MHz? You'd never even THINK of owning the PC
> > version! Well, the bottom-line Atari PC I'm thinking about is 100Mhz faster

>
> But it doesn't. :-(And if it did, you wouldn't be talking about 500 MHz machine. :-)

Don't I wish I could be so disappointed... I'd like to not be able to talk about a 500Mhz Atari computer, because a 400Mhz Atari computer was available...

> > BeAIM exists for BeOS. Works very well, too. Shouldn't take much to create

> part.
>
> Either way, you would have to convince AOL to let that happen. How would you do that?

I don't think whoever programmed BeAIM, exactly got AOL's blessing... could be wrong, but I think they "hacked" it. BeAIM doesn't support graphical smilies, for example...

> So what? People have classic and antigue cars for exactly the same reason. Not a thing
> wrong with it as far as I can see.

But you don't see old Apple II's and Atari 8-bits going for the price antique cars do either, do you? People get a bit more "expensively nostalgic" over cars of the past than computers... although I do see old black Bell and Howell Apple II's going for a bit (several hundred $$$, I think)

> > New Atari... more reason/liklihood to port Papyrus to it. No new Atari...

We're assuming that existing Atari users is just the beginning...

> Shame, yes. But it will never happen on a new Atari either. I don't believe there are
> enough subscribers to your vision for to ever happen.

Stranger things have happened... ever thought Jobs would take over Apple and SAVE it from ruin? Ever though we'd see a new, fairly radical new OS, like BeOS, when Windows and Mac were so previlant? Things thatr people think can't or shouldn't happen, sometimes DO! And the outsome can be very positive (Apple) or end up in the toilet (BeOS)... but the dream was realized in both scenarios!

> Unless it can do equal or more than I can do now with -ANY- computer, you are correct. To

Brand name loyalty is still a favorite pastime of mine... but only to a point. I used to love nVidia, but after the GeForce4 MX ploy they tried to pull, I stopped respecting them. I *might* start respecting them again in the future if they can stop cheating on those 3D Mark benchmarks! :-D

> If you keep the OS on a chip that can't be modified, you put a dent in a lot of virus

You think reformatting a HD or screwing up non-OS files isn't just as bad? Shoot, I even got hit by the mouse reverser virus once on my ST, until I killed it with VKiller... or whatever it was called... man, that was AGES ago!

> How fast is your AMD you mentioned. Because if it is reasonably old, I'd suggest you get

Athlon XP 2000+

> I'm not talking about the motherboard. I'm talking about all the potetial add in cards
> for things not supported on the motherboard. Are you planning on USB? That would help in
> this area.

Those ITX motherboard already HAVE it all... PS/2, USB, Ethernet, VGA out, etc. The only cords coming off the back of the computer are your ethernet cable, montor cable, power supply cable, mouse and keyboard cables...

Oh, wait... the ST had a built in keyboard... skip that... but you get the point.

> But any emulator runs on an existing OS, correct??? Not the same as being the native OS.

The Power Macs seemed to do a pretty good job emulating a 68040 system in ROM...

Lest you think I am, somehow suddenly oblivious to the history of Atari (which also wrote game/computer software and made game systems and arcade games), I was referring to the computer division of Atari, during the Tramiel era.

What are the "Trams" up to these days, anyway?

I'm not sure I understand? Toad Computers is no longer even selling
Atari stuff and what
do you mean made public? They used to send out friggin Catalogs for
free to everyone!
Is that not already made public enough? heh...
Toad Computers , to my knowledge, sold off all there Atari stuff to
someone else for resale.
That's like someone coming to me and saying "I seen your catalog of
stuff and it's really cool, can I
post it on my website so everyone who wants to view it can?" Well,
that would be no 2 ways YES!
Advertising, but in the case Toad isn't even around anymore (at least,
not like they used to be)
so how could they give any care?

Fun yes. But who has the money for this kind of fun? To contiually dream of something that can't possibly happen for one reason or another is totally wasteful and frustrating. Personally, I've got better things to do, like move on with life.

> So, you take up precious RAM and get nothing done in/with the application

> application. Now, how is that much different than a normal 1040ST where you
> open one app at a time to get something done, one... thing... at... a...
> time? :-)

This is true for cooperative multitasking, but in preemptive multitasking it depends of the task the application has been given to perform. Also, with OLE, if you've imported an object from one app into another app, any changes to the data in the first app will be automatically updated in the 2nd app. You can't do that with cooperative or single tasking apps. How much time is saved by this process.

"Prescious" RAM? With modern computers, this is not an issue anymore. $20 today will put an amount of RAM in a computer that wasn't possible 10 years ago.

> Try downloading a file online while using your word processor in your
> previous example. Oh, I'm sorry... you'll have to WAIT to resume
> downloading your file, while you type up a letter to Aunt Mimi! Uh, no
> thank you... not for me.

Not true. A lot of the slow down you may see here is due to transfer speeds away from your desktop, and no computer has control over that. The only thing you can do about this is to have the fastest connection speed available where you are, or you are willing to pay

for.

At work we have contiuous internet access, through a firewall, and XP will download updates automatically in the background while I'm doing email in another, and I, the user, don't see a slowdown. If the total of everything you want to do works faster than you do, it no longer matters.

My apologies, you did present it that way. But that point is solely an interesting topic of conversation. What's important is how long it takes to do the job by that clock on the wall.

And worrying about if Win98 would fit into 192k of ROM space is completely pointless. If that's an issue, let's go back one more generation and try to stuff TOS 1.0 into an Atari 400/800.

> I don't think whoever programmed BeAIM, exactly got AOL's blessing... could
> be wrong, but I think they "hacked" it. BeAIM doesn't support graphical

If they hacked it, they may have broke some law somewhere. And since BeOS didn't exactly take the world by storm, it's not worth AOL's time.

Check the prices of units in mint condition. Plus these computers are not 50 year old or older either. :-)

> We're assuming that existing Atari users is just the beginning...

And to expand past that market base, you've got to have more than what you want from the outset. What's the difference between changing it now or later? Except more costs?

> Stranger things have happened... ever thought Jobs would take over Apple and

Apple is not out of the woods yet by a long shot. And Macs are not that prevalent anymore. They just managed to make the news with some astoundingly visually appealing hardware.

> You think reformatting a HD or screwing up non-OS files isn't just as bad?
> Shoot, I even got hit by the mouse reverser virus once on my ST, until I

I didn't say it wasn't, just that there would be fewer opportunities for this.

> Athlon XP 2000+

This eMachine I have here is 2.3. Does things faster than I can think about doing them.
I can't say that for any of my Ataris.

> Those ITX motherboard already HAVE it all... PS/2, USB, Ethernet, VGA out,
> etc. The only cords coming off the back of the computer are your ethernet

It doesn't matter what you build in, someone will build something that is not built in.
You have to anticipate that in your design.

> Oh, wait... the ST had a built in keyboard... skip that... but you get the
> point.

Detached keyboards are the only way to go. We have one individual at work who puts his
feet up and puts the keyboard in his lap. Not practical with the ST/Falcon case.

> The Power Macs seemed to do a pretty good job emulating a 68040 system in
> ROM...

In their case, it's a temporary measure. Gut feeling is they did this, to a great extent,
so you could run apps on the computer that didn't exist yet in native OS X format.

Uh, when the PowerMac 6100/60 was first introduced (the first (lowest) model of PowerPC Mac), Apple only had System 7.1.2 available, which was partially native (PPC code). Apple changed the name to MacOS around 7.5, I believe it was. So, MacOS X wasn't even a blip on ANYONE'S radar until... well, a few years ago... when Jobs took over at Apple. I owned a 6100/60, when they first came out, so I know this piece of history pretty vividly.

> version of Papyrus will be the last version produced for the Atari.

Well, they said that version 9 would be the last version for the Atari, and
here they are making version 10 for the Atari. Either a change of heart, or
a delay in the stopping of its production.

> Do we have a modern spreadsheet? Not to my knowledge.

Just for the sake of discussion, what exactly is your definition of modern
for each of these, beyond comparing them with PC/Mac equivalents - I mean,
specific features for each? Is Texel 2.2 not modern? I haven't used too many
other spreadsheets to know for sure, but from what I've seen it's not bad.
Maybe if they upgrade their MS Excel importing to support features beyond
version 4 it'd be more up to date?

> Do we have a modern database program? Not to my knowledge.

Again, I haven't used too many database programs beyond Atari Works and
Papyrus, but Papyrus seems pretty up to date and full-featured. I'll do a
comparison with some Mac programs that I have (but haven't used) and see.

> Do we have a modern graphic appication of any kind? Not to my knowledge.

Apex media was almost there. Smurf is pretty cool. I would love to see a
combination of Apex Media, Vision, and Smurf put into one program. I think
the problem here is that so few of us have machines with the graphics
capabilities to handle it. Perhaps if more people had access to good
graphics cards, this would be different.

> Do we have a modern presentation program? I.E, a PowerPoint type program.
> Not to my
> knowledge.

Right. This is a big gaping hole in our software repertoire. There was
almost AtariOsk, but it was extremely expensive and quickly disappeared.

> Do we have a modern CAD program? Not to my knowledge.

Never did anything with CAD, so don't know. There used to be great CAD programs, but I'm sure they're outdated by now.

> By modern, I mean software that can stand head to toe with similar programs
> available on
> other platforms. This will be absolutely necessary to gain the converts you
> will need to
> be profitable in any new hardware venture.

I agree. However, before these can be made, we need good hardware to run it. A big catch-22. What probably should be done (in my personal dreamland, where anything can happen) is a simultaneous building of a super-modern Atari compatible along with all of the above software apps and more, designed specifically for it, with all the features (and more) of any PC/Mac equivalent. But like we've all said, I don't see that ever happening.

> Shoot, we don't even have a browser that can access all websites out there.
> At least.....
> Not to my knowledge! :-)

We'll never be able to as long as we don't have good enough hardware. Many sites are becoming Flash-based, which is extremely CPU-intensive. Perhaps with a Falcon suped up with a CT60, SuperVidel, and major bus acceleration you could hobble along (assuming the software is ever designed). But once again, it's a matter of development, and no one's going to develop high-end software that only runs on *maybe* 10% of our extremely small number of existing machines. It's also a matter of attitude. I remember reading discussions about 5 years ago, where people were arguing that Javascript would never take off as a replacement for or suppliment to standard HTML code. Now we don't have any *reliable* Javascript-compatible browsers, because no one would commit to leading-egde technologies. So we're scrambling to re-invent browsers (namely Adamas and Highwire) with 5+ year-old features and calling them "modern".

> If we could all just win a few Powerball lotteries....

Oh, don't I wish... :)

> is!

But that's what we've been doing for the past 10+ years, all the while the platform has dwindled to next to nil. How do you propose to *increase* the user base, if anyone outside of the platform only knows PC/Mac, and has no choice but to make that outside comparison? They have no loyalties to Atari (if anything, quite the opposite), and as PC's and Mac's get progressively better, fewer and fewer of us are going to remain loyal. It's already happened for the most part, except for the few of us remaining here. Closing ourselves off from the rest of the computer industry secures our already certain eventual extinction as a platform, let alone having any kind of "rebirth" as you put it.

My point exactly. At that point, the ST was a very competitive machine, better than the current Mac, and far better than the current PC. Now we are far behind, so how could your analogy hold up without any way of bringing

our machines up to the leading edge of technology and beyond? We have to have something unique that makes our machines better than theirs, otherwise we'll just be sitting here discussing how one person's CT60 Falcon is faster than another's Milan, only with fewer and fewer people.

> I believe the only real expense in building a new "Atari PC" would be the

> will guarantee recognition by anyone familiar with the ST series at all.
> Regardless how much they hate(d) it.

First, cases are probably the least expensive part of the machine, especially if you do use an already existing design mold. Second, I've always loved Atari's, but always *hated* the ST/Falcon case. A an expanded version of the TT case would be better. Or make a new, unique, and *practical* case design. The ST/Falcon's case was *anything* but practical. If a new Atari was made, and put in those nasty old cases, the first thing I would do would be to recase it into a much more roomy, nice-looking, and desk-space-saving mid-tower case.

> Only the few and far between, cave-dwelling idiots are gonna think it's no

> visual recognition... not to mention a few other cool additions to make it
> stand out...

I have no idea what you mean here. Who is going to recognize those old designs? There weren't enough people who even saw an ST, let alone those who remember it without having purchased one, to have any kind of instant recognition. And if you're aiming at the people who've already owned ST's, you're gonna end up with a market not much bigger than the Atari community today already is.

Where?! I've never seen a 500MHz Atari compatible motherboard and onboard
CPU. If you're talking about a PC-compatible with Aranym running instead of
Windows or Linux, why limit yourself to a 500MHz? You can get a *much*
faster Linux-based PC and install Aranym on it for *much* less than $500.

What OS is it then? Again, I've never heard of it.

> Multitasking doesn't slow down operations. Software bloat slows down
> operations. The more resource-hungry an OS is, the slower it runs on lesser
> hardware. Never heard of Microsoft Windows?

What?!?! "Multitasking doesn't slow down operations" is the biggest lie I've
ever heard! Never seen multitasking really in use? After more than a few
programs get loaded, it becomes obvious that you're slowing down operations.
I do agree that Windows and much of it's software is bloated for what it
does. However, the more we decide we want our machines to do, the more
resources are required to do it. You'll eventually need to get an enormously

fast machine to keep to up date, even with Atari software, as software expectations grow.

> I'd be willing to bet, MHz for MHz, Calamus on your TT runs faster that the

Some TT's can run at 48MHz, with overclocking. Also, MHz-for-MHz makes no difference if there's still a noticable difference in how software runs from one machine to another.

> BeAIM exists for BeOS. Works very well, too. Shouldn't take much to create
> an Atari version...

Great! I'll leave that task up to you then...

> program called
>> dbMAN that was 100% compatible.
>
> Maybe the source code to a dbMAN or dBase III clone exists that could be
> ported to the new Atari...

That wouldn't solve the problem. He's using the dBase-dbMAN senario as a comparison to what we have today with more modern apps, which do much more, and which we don't apparently have equivalents of on this machine, no is there the possibility of porting them. We'd have to write them from scratch.

> What they tried is to create an Atari CLONE. Based on a DEAD platform

> a dead platform is like trying to clone a dead sheep (let's name her
> "Deddie")! You might have two of them, but... who cares? A faster version
> of a dead horse is still a dead horse, to put it another way...

Ok, so you're talking about scrubbing TOS/GEM compatibility altogether? Then what's the point? How would it have anything to do with Atari then? Might as well get a Linux machine, or as you keep mentioning, a BeOS machine, and be done with Atari altogther.

> Picture a 1040ST running at 500MHz or 1Ghz with 256Mb of RAM... now how
> awesome would THAT be! Now add in an AGP 2x 3D-accelerated video subsystem!

But wouldn't that be creating an Atari CLONE?! You said that's basing your system on a DEAD platform. You are contradicting yourself left and right.

Are you talking about a TOS system or not? Also, why aim at 500MHz, when you can have a 2GHz system for not much more money? I'm not talking about caring only about MHz, as you said Ken is. I'm talking about having more system resource at your disposal. Why would I want a 500MHz TOS machine, when I could get a 2GHz one? At any rate, this is all academic and pointless, as neither of these machines exist, and they won't unless someone puts down the money to do it.

> In the Atari relam, we need to keep our eyes lower and focus on our own
> interests and goals. to me, *enjoying* a computer is half the importance as
> how much and how fast it can do. Meaning, if I don't *enjoy* using the

> That's what windows 98 SE is for me. Purely functional, very little fun.

If we're talking about making an all-new Atari machine, why would I want to "keep my eyes lower" (whatever that means)? If I'm gonna get a new computer, I want it to be the best it can be for the money I spend. I can make any PC or Mac and Atari compatible these days, fairly cheaply. If I wanted to get a "real" Atari, it would have to have a ton more to offer than what you're proposing we all "need" to do.

> Why do you think MacOS X is as different and snazzy looking as it is, today?

A friend of mine who just switched from PC to Mac, noted how much MacOS X looks very similar to Windows XP. At least a lot closer than MacOS 9 did.

> Because Apple wants to put FUN back into geting things DONE (rhyme

You *really* want to get flamed, don't you?

> Do you realize that, to this day, I love grey more than any other color?

That explains a lot! :)

> Why? Because of the Atari 1040ST. I never liked grey before that. Never
> cared about it. But now? Grey T-shirts. Grey pants. Grey paint... grey
> hair... oops... I think I'm going overboard... :-)

You only now realized? :)

> If look and feel (OS and case) and name and history ("Atari") don't affect
> your desires for a computer, then speed and functionality is all there is,
> and a PC with Windows is the only place you will get it en mass.

I use an Atari for the following reasons:

1. I love the way the OS works - but you said that TOS compatibility is trying to revive a dead horse, so that obviously won't be in your new design.

2. It does what I want, the way I want it done. PC's and Mac's often tend to make assumptions about what the user wants. That drives me nuts.

3. It's kind of cool to be able to use a computer that very few people have ever heard of.

That said, my opinion is this:

1. I would rather see a 2GHz Atari rather than a 500MHz Atari.

2. If it isn't fast, functional, and compatible with the software I love to use on my Atari, why buy it?

3. When you set your sights low, you never achieve much.

> Ever seen a MicroITX motherboard? 6.5" x 6.5" square and less than 3" tall
> at the ports in back. You can't tell me that a motherboard of those
> dimensions won't fit into a 1040ST. If the measurements of a 1040ST from
> one site I've read are accurate, the ST, in back, is 2.8" tall (round up to
> 3" just to make it easy). Think of what you can do with all the space left
> inside the rest of the case... and most of the ITX motherboards have audio
> and video aready built-in!

But even with such a small motherboard, you could never have a system with multiple hard drives, a CD-ROM, a CD-RW, and a ZIP drive. That's not even including any other hardware upgrades such as video capture cards, CPU upgrades (one *will* eventually want to get a faster machine), and a better video card.

> There's this emulator called STonX (pronounced "Stones", since X sound like

> time? :-)

This proves you don't understand what the different forms of multitasking
are. Even though the halted processes may not be actually doing anything at
the moment, the programs are still there and usable, whereas in
single-tasking, you have to completely quit the program you're running, run
the other program. Do your work there, quit that, re-run the first program,
etc. But in either form of multitasking, you have the ability to switch
between the programs on the fly without having to quit anything. Just swap
back and forth at will. *Much* better than single-tasking.

As he explained in the section you *just* quoted, pre-emptive multitasking
allows programs to run simultaneously without stopping either one. I can
easily use a word processor while downloading a file, and nothing is
stopped. Actually, I can do that with both pre-emptive and cooperative
multitasking, so I'm not quite sure how acturate the first description was,

at least for this discussion.

>> But it doesn't. :-(And if it did, you wouldn't be talking about 500 MHz

He means that you'd be talking about a *much* faster machine than 500MHz,
because the difference between 400 and 500 is relatively neglegible.

>> So what? People have classic and antigue cars for exactly the same

Not necessarily. I collect old sheet music, because I like the look of it. I
can't sell it for very much. In fact, most of it I picked up for pennies.
Money and resale value isn't the issue at all here.

> We're assuming that existing Atari users is just the beginning...

That's all you'll ever get with the specs of your proposed machine. No one's
gonna shell out money for a computer that's far lower tech than something
they can get on another platform. Especially if it runs more software and
software that uses the latest industry standards (or whatever Microsoft
decides is the standard that week).

>> Shame, yes. But it will never happen on a new Atari either. I don't

> ROM...

But they aren't emulating a entire system, are they? And they still ran their native OS, written for PPC. Emulation was only for backward compatibility during the transition period between the two processors. I now have very little if any software on my Mac that needs any kind of emulation to run.

Seeing how little you know about things like multitasking, and understanding and listening to what people say, rather than forcing your opinion as our only viable option now, I wouldn't trust you to lead us into a "new Atari".

OK, I'm late because of problems with the SDMA .
The situation is complex....I discovered that the bug I found is not alone ;
an other bug is here on the mb.
This time I fixed the CT60 for 16 and 20 MHz bus ...
For 25 MHz, I'm not sure....
I will surely stopped here and send the CT60 for 16 and 20 (it is the goal
of this product ! 25 is optional !).

Will take decision tomorrow...

Regards

3507. Goodbye "ST Computer"

Sad to say, the next (June) issue of the German "ST Computer" magazine will be the last :-(The publishers say that the loss of readers and advertising makes it unviable to continue.

They hope to include a 16-page Atari supplement in an as yet unnamed PC magazine.

For those who understand German, ST Computer has long been the best Atari magazine on the market since the old Atari World - and it was voted Magazine of the Year in the recent MyAtari poll.

Goodbue - you will be sorely missed!

I agree 100%. Wanting Atari to come back is like wanting
Ford to start manufacturing the Model-T again. It's had it's
day, and it's gone.

If some *new* product was made by a company called 'Atari',
it wouldn't be the old products that we all bought and loved. It
would be something different. So, what's in a name?

To the user, a 'computer' is the interface it presents, which is
the software 'look and feel'. An emulator is such an efficient way
to achieve this end that there's not much point resurrecting any
hardware development.

We've come to an age when the underlying hardware is
not a huge issue anymore. There are significant advantages in
the hardware being the same everywhere. (eg: price, compatibility)

The real issue is software. I'd dearly love something *new*
to emerge. That is, a better user interface and/or system concept.
It saddens me a little that so much effort has gone into Linux. Why
put such an effort into recreating an OS that was designed in
the 1960s and 70s?

I guess it goes to show that original thinking is not common,
and getting people (customers) to accept new concepts even
les common.

TOS/GEM were OK in their day, but just OK. (IMHO)
A modernised and improved GEM might hold its own against
modern versions of Windows (or X Windows, or whatever).
But why not make something completely new and give it a new
name? Why get stuck in old paradigms? The world needs
new designs, not reengineering old stuff.

[...]

Hear hear... And if we're going to dream and conceive, why
recreate 'Atari' when we can move on to NEW concepts?

> Take Rodolphe Czuba for instance. He is
> one of those genius'. If you gave him a guaranteed salary for x years, a
> decent budget and a design idea, he would create something that we could all
> have an input in, that would be the answer to a new ATARI computer. Is it
> gonna happen? not unless one of us is rich and crazy enough...

If I had 100 million dollars to invest, I wouldn't spend it on
ST compatible motherboards, that's for sure. I'd probably be
boring and buy real estate :)

But if I wanted to make a genuine contribution, I think I'd
spend it on R&D towards some new OS user interface and
programming/usability concepts that work on existing hardware,
and projected future hardware.

I don't have any huge problems with Windows as such,
but it's old stuff, really. They make it prettier in newer versions,
but in may ways it's just minor variations on an old theme. I'm
talking about the user interface here. It's basically not much
different to GUIs from the early 80s.

Of course, if someone releases some completely new
software concept, I won't promise to use it. ;)

Steve.

The application/hardware add on VidiST could have been used to make short
films. It was out long before 1991. Perhaps people with flatrate telehone
lines may have exchanged such files after packing them. It would anyway
take a loong time with a 1200/2400 bps modem...

VidiST can still be bought so if you happen to find any old film chances
are you might be able to play them on authentic hardware.

I suppose the Amiga people also may have produced short films?

Hard to tell what your mean by "K/sec"... A temperature rise of 250
Kelvin/sec really sounds dangerous :-)

I'm getting something like 1 Mbit/sec with Ethernet here on the average.
According to the PARCP homepage you could expect a transfer speed
similair to that with PARCP.

Exactly! I used such a printer spooler quite a lot and it worked
beautifully. Got it from a listing in the Abacus book "Atari ST Tricks
and Tips" and I also modified it to accept much larger buffers than the
original 64 KByte. I still have the assembler sources.

Reading the printer port is quite similar to how a printer spooler works.
A circular buffer with a read and write pointer and then let a program
read data from the buffer and move the read pointer.

>>I notice that it's the lowest priority MFP interrupt.
>>I wonder if higher priority interrupts interfere with it?
>
>I'm not sure how they could since the first thing I do is to disable
>interrupts. However, while debugging/testing, TOS does seem to think
>some of the received bytes were key presses. I'm not sure if this is
>something to do with MonST or the MFP/TOS getting confused and mixing up
>the data.

In the printer spooler interrupts are blocked during register
manipulation with

move #$2700,sr

and freed with

move #$2300,sr

>>> I don't get it all and I

>>> sending much too fast for the ST to keep up. A 300MHz Pentium sending to
>>> a 8MHz ST just doesn't seem fair but the Pentium is the slowest machine
>>> I have.

It should not matter how fast the sending computer runs if the
handshaking works.

>I think I'll write a specific app to read the port first, and then go
>back to getting the more generic one, buffering the port, working.

I suppose the easiest way to make a working application would be to mix
assembler and a highlevel language like GFA.

First an assembler INLINE that installs the busy interrupt driven port
reading code. On return a pointer to a data block with the following
organization:

+0 Lenght of buffer (4 bytes)
+4 Pointer to next read position in buffer (4 bytes)
+8 Pointer to next write position in buffer (4 bytes)
+12 Start of buffer data area

The GFA program could then easely be a GEM program and once the port
reading code is initilazed starts polling the buffer pointers to check
for incomming data.

Then the GFA code manipulates the read position pointer after it has
fetched data from the buffer.

When the user has finished "printing" the INLINE routine might be removed
so the port can be used for normal printing again? But this may be
dangerous to the printer port perhaps...

>>have the cable. I'm almost tempted to pull the old ST/e out
>>of it's box and experiment...

>:)

Whatever you do, be careful as the Atari printer port is fragile and it
is not a god habit to have two printer ports trying to print to each
other at the same time!

Have you looked at the current linux version available on the PC? From the screenshots, it has the same graphical diplay as Windows.

What I like is the virus writers are aiming at it, and if you know what you are doing, you can get all the software and the OS for free! All you need is the hardware.

Is there a page anywhere that has screenshots of the Atari version of Linux? Is it graphical or still command line based?

The company's name was "ActiVenture", and they displayed their CD-ROM
addon for the Atari ST at the 1986 Chicago Consumer Electronics Show,
at the same time Atari was introducing the 260ST, the 520ST and the
130XE.

Both Atari and Commodore had been waffling about whether or not to
attend the show with their new computer systems, and Commodore grabbed
the last remaining main show floor space before Jack decided to spend
any cash publicizing the ST.

Commodore ended up showing the Amiga 500 in a huge glittering display
on the main floor.

Atari was relegated to a small, sweaty little conference room on the
second floor to introduce the ST to the world.

The ActiVenture guy was set up between the 8bit table and the ST
display on a table at the end of the room. His product was pretty
amazing for the time. The CD-ROM drive was an external box about the
size of a compact DVD player today, and connected to the ST via the
ASCI port.

He had the "Encyclopedia Americana" (text only) on a single CD in his
suit coat pocket, which he'd whip out partway into his presentation
and hold up so everyone could see the band of data around the disc,
illustrating how much free space there still was, adding that there
was so much empty space on the disc that they would one day be able to
add pictures and sound.

Imagine, hearing John Fitzgerald Kennedy's actual voice giving a
speech while you looked at a still photograph of JFK..! (They
hadn't even thought of streaming video in those days.)

The drive worked amazingly well- it only took a few seconds to find a
subject and display it on the green GEM screen. (It would only work
on the 520ST, he told us- the 260ST didn't have enough memory.)

ActiVenture and JackT had big plans to sell zillions of CD-ROM drives
along with zillions of AtariST computers.

A number of years later, when Atari STILL hadn't put the CD-ROM drive on the market, ActiVenture took their product to the IBM market, but by then it was too late. Other companies had developed their own CD-ROM systems and had already begun selling them in a viable marketplace. ActiVenture only lasted a short time before they joined the Tramiel graveyard.

Yep. A null modem cable with DB25 for the STacy and DB9 for the PC.
Most likely you can find them without too much difficulty. I used to
use a standard DB9-DB9 serial cable with a null modem adapter on one
end and a DB9-DB25 adapter on the other.

> On the STacy I think Flash or STalker would work, and HyperTerminal on the
> MS se machine,

I'd recommend STorm for the STacy, and if you need a floppy based
copy, I'll send you one for the price of postage. (By the way,
preformatted DS/DD disks that will work perfectly are readily
available in the US and Europe. I recommend Viking Direct.) What you
do is select Xmodem receive on the Stacy and as quickly as possible
(you have a few seconds) select Xmodem send on the PC. The computers
have no idea they are not talking to a modem. Zmodem has some
advantages to Xmodem, but it's slightly harder to set up, so I'll let
you research it.

About a dozen Falcon specific ones were released commercially, and
there were about the same number of PD ones. Still others took
advantage of the Falcon hardware if it was found, but still ran on the
ST or STe.

>
> Where can I find a list of games for it? (web link)
This isn't quite what you want, but you can find the games that RUN on
the Falcon at http://www.myatari.com/f_games.txt . About two dozen
are listed as "Falcon game". About 2/3 of the ST games can be coaxed
into working on the Falcon -- I played Railroad Tycoon on it last
night.
>
> Is it possible to find Falcon emulator for the PC?
For many years Atarians hoped for a Falcon emulator. The closest so
far is Aranym (I hoped I spelled that correctly). It isn't designed
to be an emulator, but it's the only thing I know that runs TOS 4.04.

>
>Programming a PC is screwing with my brain... *sigh*

Which is one reason I don't like coding on my PCs that much. It just
doesn't feel anywhere as pleasurable as coding on an ST :(

>I've looked at your code, and I've read some Atari
>books which I have, and I have a few comments to
>make which may or may not be helpful.

I'm glad you did. It's helped me spot a few things that I missed.

>1: Ports A and B of the PSG are bidirectional,
>but the direction has to be set before reading or
>writing to them. Port B is the printer data port.
>Since it's normally an output port, maybe it should
>be set to input (Once only, perhaps...)

Maybe. I think it might be an idea to add a little extra code so both
reading and writing is possible without a reboot.

> Write 7 to $FFFF8800 to select the mixer register
> AND $fe to $FFFF8802 to set port B to input
^^^
should be $7f. Bit 7 is port B. Clearing bit 0 turns on sound channel A,
which I don't think other users would be appreciate very much :)

I'm thinking of adding some wrapper code to the BIOS BCOSTAT and BCONOUT
functions. My idea is to set it to output before the call, and then
reset it to input after the call.

>2: It's not clear to me whether port B should be read
>from $FFFF8800 or $FFFF8802. From what I've read,
>it seems that either should work once the register is
>selected by writing 15 to $FFFF800. Do you know?

My understanding is that you write to $FFFF8800 to select the required
register. If you're reading the value, you read from $FFFF8800 but if
you're writing a value, it's written to $FFFF8802.

> Or perhaps XBIOS functions 28, 29, and 30 should
>be used for this stuff.

That's basically what set_strobe_high, set_strobe_low and the_bits do,
with the_bits being the only non-specific function.

>3: The following lines appear in your handle_int function:-
>
> bset.b #7,$fffffa0f.w

>for the monochrome monitor detect interrupt. Why?

In Software End-of Interrupt mode, which is the STs default mode, if
there's an interrupt in service all the lower level interrupts are
ignored. As the monochrome monitor is the highest level, I set and clear
it to try stop other interrupt interfering. The "or #$700,sr" should but
this is added as a precaution.

>4: move.b d0,4(a5,d7) * write byte into buffer

Oops. I got that bit right in readbyte but missed it in handle_int. Now
sorted :)

>5: Is this just to take up a little time?
>
> clr d0
>.loop
> dbra d0,.loop

Yes. I put it in to try and slow down the transfers.

>6: I don't understand your the_bits function.
>Are you sure the right values end up in the right
>places?

It should be. It's very similar to, if not the same as, the bit in TOS
that does the exact same function.

>Consider the_bits being called from
>set_strobe_low.
>

```
>set_strobe_low
> lea strobe_flag(pc),a0 strobe_flag -> a0
> clr (a0) clear strobe flag
> moveq.l #$df,d2 D2 = $df Mask to lower STROBE?
> movem.l d0-2,-(sp)
> move sr,-(sp)
> or #$700,sr
> move #$0e,d1 D1 = $000e
> move.l d2,-(sp)
> bsr.s the_bits call the_bits
```

With bit 7 of D1 being clear, the_bits returns the value from PSG register 14 in D0.

```
> move.l (sp)+,d2
> and.l d2,d0
```

And using the mask in D2, bit 5 is cleared.

```
> moveq.l #$8e,d1
```

Here, the bits 7-31 are set to 1.

```
> bsr.s the_bits
```

And, because we've got the bit 7 set, this time the value in D0 is written to the PSG, register 14 again (

```
> move (sp)+,sr
> movem.l (sp)+,d0-2
> rts
>
>So, D1 = $e, and D2 = $df
```

Before the first call to the_bits, the value D0 is ignored. It's only of importance for the second call. Of course, I could save 4 bytes by using this instead:

```
> movem.l d0-2,-(sp)
> move sr,-(sp)
> or #$700,sr
> move #$0e,d1 D1 = $000e
> bsr.s the_bits call the_bits
> and.l d2,d0
> moveq.l #$8e,d1
bclr.b #5,d0
> bsr.s the_bits
> move (sp)+,sr
> movem.l (sp)+,d0-2
> rts
```

<Snip>

```
>the_bits
```

> move.b d0,2(a0) write d0 to port A.
>
> What are the contents of D0 ???
> Did I miss something?

You did. See the explanation above :)

<fx: time passes, code gets updated and the results tested>

After all the code changes, and slowing the transfer down to a single byte per second TOS is still confused about just where some of data is coming from. It still seems to think the occasional byte coming from the printer port is a key press, and it's still crashing and locking the system. Looking closely using the debugger, it seems that something is causing a large chunk of memory to be overwritten, although looking at the buffer, it seems to be storing the bytes as they are received.

I think I'll put this pair of apps aside and just write one that specifically reads direct from the port without any buffering.

Regards,
David Bolt

Ooops, yeah.. Got it mixed up with the ISRB bit.

Yeah, that makes sense. I guess the printer port data is the only
thing that ever gets read anyway. Katherine Peel's book lists
FF8800 is read, and FF8802 as read/write.

Tricky! I didn't know you could do that. Does it work?

[...]

Yep, I see where I went wrong, thanks. As for saving 4 bytes.
I don't think saving bytes is an issue. I'd be inclined to use inline
code rather than call a multi-purpose subroutine. That way the code
is a little faster, a lot clearer, and it would only cost maybe 30 or 40
extra bytes in the whole program.

When you sorted that line: move.b 4(a5,d7.L) instruction,
did you add a clr.l d7 before you read in the buffer pointer?
Maybe the high order word of D7 is non zero...

> I think I'll put this pair of apps aside and just write one that
> specifically reads direct from the port without any buffering.

Polling might be much faster. I read the docs for a
fast print spooler, and the author said that spoolers that
'only transferred one byte' per interrupt were very slow.
I don't know why that would be so, but, apparently it is.

Steve.

Perhaps you could read the port directly by polling? I've never
used GFA, but it has all the low level access you need, right?

Steve.

Yeah, it's good that Linux is competition to Windows... But it's a shame
that the only way to compete with Windows is to *become* Windows.
Perhaps that's the nature of standards, though... Ah well...

> What I like is the virus writers are aiming at it, and if you know what you are doing,
you

Yes! I'm not at all anti-Linux, by the way. But here's what
Rob Pike (co-author of The Unix Programming Environment) has
to say about it. http://cm.bell-labs.com/who/rob/utah2000.pdf

"Linux

Innovation? New? No, it's just another copy of the same old
stuff.

OLD stuff. Compare program development on Linux with
Microsoft Visual Studio or one of the IBM Java/web toolkits.

Linux's success may indeed be the single strongest argument
for my thesis: The excitement generated by a clone of a
decades old operating system demonstrates the void that the
systems software research community has failed to fill.

Besides, Linux's cleverness is not in the software, but in the
development model, hardly a triumph of academic CS
(especially software engineering) by any measure."

> Is there a page anywhere that has screenshots of the Atari version of Linux? Is it
> graphical or still command line based?

I have no idea. My ST/e has been in the box for five
years and I'm quite out of touch with the Atari scene.

Steve.

I don't think so as there is no way to know when there is new data to
read from the port.

My first little GFA attempt tried to simply manipulate the strobe (acting
as busy) and read one byte after a quick up-down-up of the strobe voltage
but that did not work at all.

> read from the port.

Yes there is, as long as GFA can read the appropriate signals,
and I'm sure it can.

You can do it by polling in a loop something like this:-

read_char:
lower STROBE (NOT BUSY to the sender)

wait for BUSY to go high (STROBE from the sender)

raise STROBE (BUSY to the sender)

read the character

Call this subroutine for each character you want to read.

There's a simple diagram of the protocol signals here:-
http://www.beyondlogic.org/spp/parallel.htm

According to that URL, the STROBE pulse from the
sender is supposed to be low for at least 1 microsecond.
The only problem you're likely to have with polling is
looping too slowly and missing the pulse. If the computer
that's sending the data is old, I'd guess that the pulse is
longer than 1us.

Actually, now that I think of it, the short duration of
the STROBE pulse does make polling difficult. But it
might be worth trying, though it might need some
handwritten assembler rather than GFA...

bit 0 at $FFFFFA01 is the centronics busy bit. This
bit becomes zero for the duration of the strobe pulse from

the sender, when using a crossed cable.

You probably need to set the centronics port to
input mode before doing anything by clearing bit 7
of the sound chip's mixer register. (As corrected
by David Bolt).

Write 7 to $FFFF8800 to select the mixer register
AND $7F to $FFFF8802 to set port B to input

> My first little GFA attempt tried to simply manipulate the strobe (acting
> as busy) and read one byte after a quick up-down-up of the strobe voltage
> but that did not work at all.

If you're emulating a printer, you DON'T send a STROBE pulse.
You react to the STROBE pulse from the other end.

Here's the protocol in a nutshell, for sender and receiver.
This assumes a straight though cable, so STROBE is the
same wire at each end.

SENDER (computer)

Wait for BUSY to go low (not busy)
Output the byte
Pulse the STROBE line low for 1us

RECEIVER (printer)

Keep BUSY high unless able to receive a character.
Set BUSY low when available
Wait for STROBE pulse.
Set Busy high
Read the byte

Of course, when you're emulating a printer and using a crossed
cable, the meaning of STROBE and BUSY are reversed.

My apologies if I misunderstood you and you already
know all this stuff.

Steve.

Well that wasnt what he wants to do. He wanted to use a standard 9 pin
joystick on a PC's 15 pin analog joystick port. Its a simple wiring job.

If you do want to convert an input to serial you could use a pic chip which
if you have a programmer would be the easiest and most flexible.

First of all I would advise you install MiNT and MiNTnet. This will
give you a good tcp-ip stack.

Ethernet cards for the TT exist, you need to be lucky to find one
though. They were made by a company called Riebl and have AUI and BNC
interfaces. Speed is around 2 Mbit.

You could also use one of these 'connect ethernet via cartridge port'
solutions. Google for 'ethernec tt'.

If ethernet isn't possible, install a ppp deamon under MiNT, and set
up a full SysV init style system using mgetty. This will allow you to
start a login session on a serial port. You can have a windows box
'dial in' to the TT, authenticate and log on. This will give you IP
traffic between the PC and the TT, use some ICS on the windows box.

When MiNTnet is up, you can start any MiNTnet compatible browser from
(multi)TOS.

Mail me if you need some more pointers.

Cheers,
JM

Hi,

It seems impossible to run MagiC Mac on this machine .... of course
using os 9 (9.2.2)
The same configuration works perfectly since years ago on both my 7600
and 8600 G3 and G4 upgraded.
I can't understand what's happening.
There is always not enough ST ram available to start or, if I try to
allocate memory for needings I get an unknown error from MagiC ....
Is there anyone experiencing the same problems on a PowerBook G3/400 Pismo ?
Does it exist a hint or something hidden I must know ?

Thanks for any help.
Please could you also answer on my mail because I'm not often here.

Jo

The company's name was "ActiVenture", and they displayed their CD-ROM
addon for the Atari ST at the 1986 Chicago Consumer Electronics Show,
at the same time Atari was introducing the 260ST, the 520ST and the
130XE.

Both Atari and Commodore had been waffling about whether or not to
attend the show with their new computer systems, and Commodore grabbed
the last remaining main show floor space before Jack decided to spend
any cash publicizing the ST.

Commodore ended up showing the Amiga 500 in a huge glittering display
on the main floor.

Atari was relegated to a small, sweaty little conference room on the
second floor to introduce the ST to the world.

The ActiVenture guy was set up between the 8bit table and the ST
display on a table at the end of the room. His product was pretty
amazing for the time. The CD-ROM drive was an external box about the
size of a compact DVD player today, and connected to the ST via the
ASCI port.

He had the "Encyclopedia Americana" (text only) on a single CD in his
suit coat pocket, which he'd whip out partway into his presentation
and hold up so everyone could see the band of data around the disc,
illustrating how much free space there still was, adding that there
was so much empty space on the disc that they would one day be able to
add pictures and sound.

Imagine, hearing John Fitzgerald Kennedy's actual voice giving a
speech while you looked at a still photograph of JFK..! (They
hadn't even thought of streaming video in those days.)

The drive worked amazingly well- it only took a few seconds to find a
subject and display it on the green GEM screen. (It would only work
on the 520ST, he told us- the 260ST didn't have enough memory.)

ActiVenture and JackT had big plans to sell zillions of CD-ROM drives
along with zillions of AtariST computers.

A number of years later, when Atari STILL hadn't put the CD-ROM drive on the market, ActiVenture took their product to the IBM market, but by then it was too late. Other companies had developed their own CD-ROM systems and had already begun selling them in a viable marketplace. ActiVenture only lasted a short time before they joined the Tramiel graveyard.

One of my friends has a Digiview video capture device for his Amiga 1000 and
made some short black and white films of himself (a bit like Max Headroom,
if you remember that character) and uploaded them to various BBS's via
modem. This was well before 1989 (the manufacturing date on my Digiview,
which is version 4)

Regards,

Clockmeister.

This would have been before 1989...

You guys are talking about database, then a comment like: "No
graphics, unacceptable in today's world"

Databases, come on.
See the graphic capability or the UI for db2, oracle, informix etc.

Or maybe Access from microsoft is exactly what you're looking for in a
database?

Makes more sense?

If its available then try it, you've nothing to lose, and everything to
gain.

Do you have an ST available to test the kit on?.

Where in the world are you?.

Hi!

I'd read about this somewhere. Most MagicMac versions only work with MacOS up to 9.1, and they made special versions to work on 9.2 and X. I'm not 100% sure of the details, so I'm sure there's more to it, but that's my understanding of the situation.

::laughing::

Frederic,

I -think- we are on the same wavelength here. :-)

My comment was meant to refer to Atari database programs, not programs on other platforms.

And yes, something like Access but for the Atari is what is needed if you are going to attract new users to this platform.

Ken

For your interest, for a database to be 'truly relational' doesn't
mean very much. A 'relation' is just a two dimensional table,
nothing more, nothing less. A relational database is one made
from such 'relations'.

The innovation of relational databases came from the fact
that various complex database structures can be represented
in simple flat files.

I was a bit surprised when I first read about relational
databases. I'd always assumed that 'relating' was something
to do with tables referencing other tables.

Houston, we have a problem... I've been searching for
centronics interfacve info online to try to get an idea of
the time restraints during transfer. I got a bit of a surprise.
Basically, the data becomes valid less than 1 microsecond
prior to the strobe pulse. The strobe pulse has a duration
of about 1 microsecond. The data might only be valid
for another microsecond or so after the strobe goes high.

There's some variation in the docs I read because it's
almost an ad-hoc standard, but the *minimum* time for
which data must be valid is only 1.5 microseconds.
My guess is that this is often much longer in practice,
but probably not *that* much longer.

It takes 44 clock cycles for a standard 68000
to respond to an interrupt, including time to fetch the
first instruction of the interrupt handler.

On an 8MHz ST, that's 5.5 microseconds gone
immediately.

So I'm thinking that we can't use an interrupt
to read the port, and even polling on an 8MHz ST
will be too slow for a sender with minimum timing.

Steve.

HOLY SHIT...!

Doesn't your elementary school teach any Network manners to its little
kids..?

That's the most IRRESPONSIBLE "sig" I've EVER SEEN.

Go call "The Screensavers" and ask them what "Nettiquete" means.

Tell Leo about your damn 30 LINE SIG and ask him what he thinks.

You think the Internet is your playground..?

Who the hell cares if you have a 14.4 modem..?

God.. why do they let little kids like this have modems..?

BobR

You are a bit off here. Internet addresses have the form a.b.c.d,
where each of a, b, c, and d are values from 0 to 255. Dynamic
addresses are assigned to people like you and me from ISPs, who get a,
b, and c assigned to them. Thus, what Neotrace is doing is probably
looking up the ISP. At best, you might get the city or region, but
you certainly wouldn't get the address. ISPs do keep records though,
so a law enforcement officer probably could find out who sent a given
message. I doubt others could.

Of course, there's such a thing as covering your tracks, but most
people probably won't or don't know how to do so.

Galen

ah! "available" :) Unless the guy who sent me the Falcon version reads
this and is willing to resend it then it's an all out hunt for it! Let the
hounds loose :)

>Do you have an ST available to test the kit on?.

tested the wand on a MegaST4. In general, the unit works! It scans, DPI
and letter/photo can be set.

>
>Where in the world are you?.

located in Florida.....(the lightning capital of the world) in a county
that's the lightning capital of Florida (according to the power company
and my repaired fried Falcon/modem and what ever else was hit by the bolt
including my jaw which was sore for a week from being on a second phone
line when the bolt hit) !!! Knocked me across the room /:)

No, the problem is not the OS version, but the hardware. MagicMac
seems not to run with newer hardware. Sometimes it runs with older OS
versions and newer hardware, but not with newer OS versions on newer
hardware. With older hardware like a beige G3 it perfectly runs with
9.2.2.

There is no version of MagicMac for 9.2.x as far as I remember.

There is no version of MagicMac for X, in fact MagicMacX running on X
is a totally new application.

Uh huh- close, but no cigar.

From the McAfee "NeoTrace" Support page:

http://www.mcafee.com/myapps/neoworx/default.asp

" Can NeoTrace trace to the individual's computer?

Summary
This article explains whether NeoTrace can trace to the individual's
computer.

Solution
Tracing to the Individual's Computer

Email tracing isn't going to trace to the user of the email address,
but rather to the mail server that the email address would use. For
example, in the case of a yahoo.com email address, it's only going to
trace to yahoo.com's email server, not to the location of this user.

Return to Summary. "

It's a fairly standard TRACERT program coupled with a cutesy map
display.

The closest you can get is the ISP hosting the Dynamic IP you're
tracing. Like is says, if the person is using AOL or Yahoo, it's
going to say they live at "AOL" or "Yahoo, USA".

Sarah's reasonably cute, but she needs to have Megan explain things to
her better.

It was not that ....
I succeeded to run MM with the version 6.1.5 ......
6.1.4 simply refused ..... I don't know why

I also used the english translated file made by Dennis Vermeire and his
friend ..... it worked for the first time for me :)

That's all beyond my poor understandings. Right now I'm still trying to find the power supply for the modem I used, or else find out if I can somehow use the programable port on the TT to handle a faster modem and then find one someplace.

I used to use CAB for the web when I did have it online, but mostly now I want to for e-mail.

There are also plenty of ways to access Usenet that leave no public trace of your IP address. Some ISPs' news servers don't insert IP addresses into headers, or insert them in an encoded form that's useless to outsiders. There are also anonymizing services that exist explicitly for this reason. Even a simple approach, like using a purely local dial-up ISP, but one that operates in a different locality than the one in which you live, would cover your location pretty well, at least based on the IP address alone. In sum, anybody with a modicum of knowledge who's willing to expend a small amount of effort can hide his or her identity in Usenet newsgroups, at least from the general public. As Galen says, law enforcement is another matter; they can get an ISP's logs, which are likely to reveal additional information. Even in a private lawsuit, such data might be made available -- try typing "Verizon RIAA" into Google sometime for plenty of information on one recent high-profile case, albeit not one that involves Usenet (AFAIK).

3566. CT60 : END of TESTS and DEBUGGING

Newsgroup: comp.sys.atari.st
Date: 2003-06-11 15:13:36 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ee74712$0$5420$626a54ce@news.free.fr>
Source record: 26545

Yes, this day I can tell you that my CT60 is working fine at 66/16 66/20 and 66/25 MHz !
I found a last bug on the BUS arbiter....
All runs fine here...!

I decide to begin shipping tomorrow !!

DON'T CONTACT ME TO ASK ME WHEN YOU WILL RECEIVE YOUR CT60 !
PLEASE !!

Each packet I will post will be followed the same day by an email to the destinary !
So, you've just to wait for an email !

Before the end of this week I will put the hardware installation documentation (with photos) on my web site !
You will be informed and invited to read it attentively....I will answer to your questions if some things are not clear (I don't thing)... and so improve the documentation.

The first people to receive the CT60 will be the developers AND the swedish guys (because of their Nordic Atari Show the July 6/7th). Sorry for the orther countries ;-)
All these first guys will have the heavy responsability to beta test the CT60.

A period of 1 week to... more (what could be happen ?) will be past before shipping to other people.

Regards
Rodolphe

Carey,

Uh, no. First of all, if we had their actual IP adress this wouldn't be an issue. I can post and appear to be whomever the hell I want but the IP is what is traceable. Using an anonymous remailer gets around this problem. You can trace the IP to the remailer but no further. There really is no way to get the guys except through reporting them to the remailers (irresponsible use), as well you can get them through the inforamtion they let slip. That's it.

But posting something like this makes you look foolish... Only reason I say this is because this scare tactic would only work if they didn't know that what you said was false. I'm quite certain they do know what you said is false. ;-)

Besides, using a basic traceroute you can still figure out with good precision where the user's mail or news server is.

KS>Is there a page anywhere that has screenshots of the Atari version of
KS>Linux? Is it graphical or still command line based?

Of course it's graphical (if you like).

Unfortunately you need 14MB ST-RAM for the latest Debian distribution, so ATM there's no chance to get the latest kernel running on an ATARI with NOVA graphics card. :-(

Greetings,

Some of you may have dealt with Vernal Elm in the past and had good results, but it's how a company handles bad situations that proves their integrity. The company sells Moto 68060 cpu's.

The short version: do not deal with Vernal Elm. Especially do not paypal them any money, as they have shown that if they feel they can get away with it, they will accept the money and not show anything for it. On ebay, well, they have to deal with building up a catalog of positive feedback. I have no doubt though that as soon as they do, their unethical practices will surface again.

The long version: I just filed a complaint with the Better Business Bureau of Connecticut about their online business. They claim shipping within 48 hours.(incidentally, they charge $6 for shipping, but my cpu was in a reused mailer with a 60 cent stamp on it) After I clicked on the paypal button, I had to email them 3 times to get them to respond and ship me the chip. I got it more than 3 weeks after I ordered it. They claimed it would be a full version. It was clearly marked EC. And. . . it didn't work in my Amiga 4000 CSPPC (233MHz ver). I swapped out my old chip, stuck it in, and the machine would't boot. I tried it again, reseated it, and got the same results. The old chip went back in and it was fine. Well, they also claim a 30 day refund/replacement guarantee. I email them about it. They take their time getting back to me (this becomes a pattern). They tell me to send it back, and I do, on Feb 26th. The package goes unclaimed. I email again. I send it back a second time on April 2nd, after hearing an excuse about large packages not being delivered (as if that were believable.) This time, it IS accepted (at 10:49AM on April 9th: see www.usps.gov tracking #7002 2030 0005 5261 1831), and after that all contact from them ceases. I email 3 more times, but get no response. Who knows, maybe they've ebay'ed it already.

So that's the long and short of it. It's amazing that when a company is unethical, it starts from the very minor things: cheating on shipping charges, shipping late, ignoring emails, sending the wrong merchandise, and finally refusing to honor refund policies. Yes, I know that I should have stopped trusting them in January, and yes, it IS after 30 days, but that's only because they WAIT 3 weeks to reply to any email.

Hallo Hallvard!

HT>Reading files like this on the Atari ST surely gives problems with
HT>lines containing hundreds of characters.

Why? Any useable text editor (and any viewer) is capable of wrapping the lines.
The ancient Tempus 2.25 can do so, and so can QED. The latter has also got a
built-in "Umlaut" conversion, and can handle various types of line endings.

There's absolutely no need to touch english-language ASCII files.

mit freundlichem Gruï¿½ aus Bubenreuth

Ekkehard

Son of a bitch. I bought a chip from them that is supposedly mislabeled and is supposed to be a 68060 FULL, but it is clearly labeled an EC or something like that.. I believe XC68EC060RC60. Of course he'd jump at selling them to us. Why we have to wait over a year to get our accelerator to have any viable platform to actually test our chips in . Makes perfect sense if they are illegitimately selling "mislabeled" chips that are in fact not mislabeled.

I can assure you, if my chip is not a 68060 Full I will pay them a visit. Until them I have to give him the benefit of the doubt stating that it did take a while for the chip to come, but it was properly packaged and in good condition.

On the PC, UltraEdit will do this conversion, as will many others. On
the Atari side, STeno (and probably most other text editors) can be used.

A few weeks ago I registered on DOITF030 to get a key so I can freakin have a look at the FAQ.

Then a few days ago I get a email telling me it has a serial or key for DOITF030. I look at the attachment and it is a file with the extension .scr I click on the link and my Antivirus alerts me that it is a virus! Thankfully I didn't get infected!

I am thinking someone hacked into the site to get my info?

What gives!

Tim

Hi Jo,

>There is always not enough ST ram available to start or, if I try to
>allocate memory for needings I get an unknown error from MagiC ....
>Is there anyone experiencing the same problems on a PowerBook G3/400 Pismo ?

Is the +MagiCMac extension activated in the System folder? If it's not active
MagiCMac won't be able to allocate ST-RAM memory....
Supposing it wasn't active: activate it and reboot. Next start up the MagiMac
config program and allocate the amount of needed ST-RAM. Quit MagiCMac and
then launch it again....
Everything should work now :-)

Cheers from Belgium
Dennis

Just in case you were wondering:
On a PowerMac dual G4/1000 version 6.2 runs perfect under OS 9.2.2, well,
it doesn't actually run, flying is more like it :-)
I've also seen it running on a iMac G4/800 and eMac G4/700 so I would say
that you've done a pretty good job.

Cheers from Belgium

Hi Jo,

>I also used the english translated file made by Dennis Vermeire and his
>friend ..... it worked for the first time for me :)

Of course it works,
Have you even known a "piece of art" from DDP not to work? :-)

People using MagiCMac 6.1.x or 6.2 who are fed up with the German mumbo jumbo should take a look at the DDP webpages (see sig) and download the translation. The package translates the configuration menu and the specific MagiCMac error messages, and we've even thrown in the most recent Magixdesk.... If we can figure out how to use the VISE Installer, then in the near future we'll also release a translation patch for the kernel. For obvious copyright reasons we can't put the translated kernel on the website.

The package only converts MagiCMac 6.1.x and 6.2, *it will not work* with version 6.0 or 6.01... get an update from ASH and support the author.

Cheers from Belgium

Pretty freakin sad that the virus gets to me before the freakin serial!
Good thing I really didn't need to look at the FAQ (figured it out on my
own)

That DOITF030 serial thing is pretty freakin useless if you ask me. It has
been weeks when I needed to get some info and I still to this day cannot
read it's contents.

And a google search reveals that there is all this secrecy on the keyfile
and the urgency to register!

Unbelievable!

Hi Ken,

>I know, but I was interested in version 2.3.

There is no official version 2.3
Thomas Much released a beta version 2.3 which expired on 31st december
2001. The beta didn't add any new features but only addressed a couple of
minor bugs. Some of these bugs have been corrected in the DDP Texel 2.2
release. So, one could say that the English replacement for Texel 2.2 is
better then the original... :-/

I know. In Access, each table that you relate must have a common field having the same information. But not all tables in that database have to use the same field. It can vary, just as long as each of a relation have the same field.

>
> The innovation of relational databases came from the fact
> that various complex database structures can be represented

That and the fact that a lot of wasted hard drive space can be eliminated by not having to store blank fields.

Way to ruin my thread guys!

Anyway, I sure hope your 060 works. Otherwise, good luck getting any sort of refund or replacement from them. I especially advise against sending them any money without making them accountable for it. [like ebay feedback]. Paypal'ing them money was like flushing it down the toilet since paypal's dispute system has to be used within 30 days, and they happily wait that time period out before even replying to emails.

I recently bought an Apple TiBook from eBay. The seller is legit but I
couldn't ignore the safety that escrow provided for only a few bucks.
It's a shame it just doesn't seem worth it for smaller transactions like
these. And besides, eBay feedback is a commodity - it's for sale, and
it's easy to build up cheaply. eBay feedback isn't exactly a 100%
foolproof system... unfortunately.

Cross-posted to: comp.sys.amiga.marketplace,comp.sys.atari.st

I wish that Eric Han's post had been done a month ago! That's when I bought VernalElm's XC68060RC chip on eBay (May 13). To date, despite multiple emails to at least three different addresses, and one phone call (his answering machine, no response), VernalElm/Berkowitz continues to stall and deliberate. I've had a single response (polite, and alluding to unspecified problems) assuring me that delivery was imminent. He sent this on June 3rd, and I've not heard from him since. I forwarded immediate payment after the auction, (PayPal from bank account, not credit card), and now I suspect that $63 is gone for good (including the $1 for "insurance"). I also contacted four previous eBuyers of this chip. Two Brits said that VernalElm's service was slow but that they eventually received the item around the 30-day period (one buyer subsequently auctioned the EC version of the 68060, but I don't know if it was the one he had bought from VernalElm of if it was an old chip he already had). Two others did not respond. The whole affair is disturbing enough, but given the fact that VernalElm has continued to sell & buy items on eBay during this entire saga makes it all the more frustrating. I may still receive the item I paid for, but I'll never knowingly deal with this company/person again! Regards from Colorado, George

Hi Bob,

>at the 1986 Chicago Consumer Electronics Show, at the same time Atari was
>introducing the 260ST, the 520ST and the 130XE.

I think you've got some dates mixed up;
IIRC the 260 and 520ST were shown to the public for the very first time at
a US show in december 1984. In march 1985 the 260ST was available and for
sale in Europe.
In may 1985 I bought one :-)

>A number of years later, when Atari STILL hadn't put the CD-ROM drive
>on the market, ActiVenture took their product to the IBM market, but
>by then it was too late. Other companies had developed their own
>CD-ROM systems and had already begun selling them in a viable
>marketplace. ActiVenture only lasted a short time before they joined
>the Tramiel graveyard.

The Tramiels always said that they would release the CD-ROM drive when the
price was right (remember their slogan ?) Unfortunately for them that
particular piece of new technology remained high priced....
IIRC Atari made two models, and the newer one (way back in 1990) was sold
in very limited quantity to the public, it came with a CD full of freeware
and costed $1200. That's a lot of money to spend on a piece of hardware for
which there's no software....
IMO it's not really fair to blame Atari for their CD-ROM not catching on,
the problem was that the hardware was expensive and that non of the Atari
softwarehouses were motivated to develop software for it. But let's face
it, the CD-ROM market only really took off in the 90's, and by that time
the only CD-ROM Atari sold was for the Jaguar...
Another point to consider is that the hardware wasn't really suited either,
except for the Falcon which was released when the CD-ROM revolution already
began, non of the Atari computers could display 256 colours in VGA mode,
and that wasn't very encouraging for would-be developers...

Cheers from Belgium
Dennis

> Another thing to consider, along these lines of thought, is that Atari of
> the late 70's and early 80's, under Nolan Bushnell, went bankrupt and was
> bought by the Tramiels.

Actually, Nolan Bushnell sold Atari to Warner Bros. in the 1970s. In the 80's Warner Bros.' Atari was leaking money like a seive. They split the company in two. Atari Corp. which was the home computer/videogame department and Atari Games which was the arcade department. Only Atari Games was making money so Warner Bros. sold Atari Corp. to Jack Tramiel. Atari Games was later sold to Midway.

Atari Corp. came back strong in part due to Jack's penny pinching. He seriously streamlined the business proceedures and made getting money for your budget inside Atari damn near impossible. People had to become very creative in order to get their jobs done. The problem was Jack didn't know squat about actually selling computers in the late 80s much less the 90s because his head was still stuck in the 70s.

The Atari ST was a big hit at the time and it's momentum carried the company forward for awhile, but unfortunately because of Jack's tightness new products being released from Atari were very late in coming to market and basically re-hashed older products. Anytime the boys in R&D would come up with something truly amazing you could count on Jack's son Sam, who was president of the company, to strip the machine down to save cost and thus making it underpowered and then to completely bungle production so the machine would be late getting to market thus giving the competition an even bigger edge. There was also very little advertising and what little advertising Atari did was mostly "preaching to the choir". By the time the 90s came most people thought Atari had long since gone out of business and the PC market belonged to the x86 machines and a little slice for the Mac.

In the 90s Jack saw the writing on the wall and realized he was a dinosaur and simply had no idea how to compete. Atari had just won a 98 million dollar lawsuit against Sega. 50 million of it was settled in cash and the rest was settled in Sega stock. Jack knew that if Atari continued to operate it would simply squander all that cash. Not wanting to see the cash evaporate Jack used some of it to buy a failing hard drive company known as JTS. He then merged Atari with JTS and had them run under the JTS banner. Now here's the interesting part. When one company merges with another company it is customary to pay the top executives of the absorbed company a bonus for fascilitating the merger. So the owner if JTS, Jack Tramiel, paid the owner of Atari Corp., Jack Tramiel, a 42 million dollar bonus for fascilitating the merger of the two companies. Jack effectively emptied

Atari's coffer's into his own pocket and it was 100% perfectly legal.

Now the SEC only allowed the merger on the grounds that Atari still be run as a company. So Jack basically turned Atari into a one person operation, it still operated as a single person who answered the phone "Atari Corp." and would say "We no longer support that product.". This is where he was on shakey ground and a group of stock holders launched a class action suit against JTS claiming they were violating the SEC orders that Atari be kept up and running. The lawsuit never got very far, JTS sold off all it's Atari assets to Hasbro for a paultry 5 million dollars (the joke at the time was JTS could have gotten more for the Atari assets if they had sold them on eBay). JTS later ended up selling the Atari assets to Infogrammes for somewhere around 40 million dollars if I remember correctly. JTS went bankrupt shortly afterwards but Jack didn't care. He'd sucked it dry of it's last dollar and retired a wealthy man. Infogrammes, recognizing the great nostalgia value of the Atari name and properties, eventually changed it's name to Atari Inc.

Hello Dennis,
Nice to see you on the newsgroups. Have not heard
from you in quite some time. I remember all of that
happening around that time because I had just gotten
my Atari 130XE and was receiving alot of Atari
Magazines that were popular at the time. Antic, Antic
ST (forget what they called it) and a couple of
others that I cant remember off the top of my head.
But that was back in 1984 and early 1985. Matter of
fact I got my 130XE in early 1985. Not to contradict
what you were saying but does the Falcon 030 not do
256 colors in VGA mode??? Maybe you meant stock from
the factory?? E-mail me sometime.

Thanks,
Carey Christenson

I took a look. Just remember that about 10% (yes, ten per cent) of all males on
Earth are colorblinds. Red letters on a dark background are a pain to read.
Why do you think that almost everywhere we look (books, newspapers etc...) they
use dark letters over a light background?

Have a good day!

Why bother? Responding to such childishness just encourages it, and wastes
your own time.

I know where that's at, i was on the phone during a storm once when i saw a flash out of the corner of my eye, a short while later i realised something wasn't right as i came around, my USR modem was smoking and my MegaSTe frozen, luckily a reboot sorted the Mega, the USR was history!.

Well I did not register on the web site with a news reader. What the heck
are you talking about??? AFAIK I did not post anything regarding DOIT030 on
usenet, I went to the web site and entered my info there.

Yes I am a little fucking pissed off that I got a virus, excuse me. It's
just that I needed some info last month for my unheard of Atari Falcon
Computer and couldn't find it, then when I come across that site and
download some Zip reference file, I need a serial number to access it. So I
have this large Zip file just sitting on my HD the last month waiting to be
able to view it... Then I get a reply. I thought great now I can read up
on the falcon from that archive that has been sitting there on my HD
fragmenting the shit out of it this past month!! And it is a virus...

That really pissed me off! I though, damn, pretty sad when I get a reply
from a fucking sorry ass no life having idiot spreading a virus, than
actually getting a reply from the author with a keyfile! I am not blaiming

the author, and he may have his reasons to require a registration, but it's just irritating thats all!!

Sorry for the venting.

Tim

The email address listed here. And NO, nobody send the virus because they saw it on here. How did they know I registered to get a keyfile? Are they psychic?

Well how did I get a virus then? Spoofing a reply for a keyfile for my DOIT030 request on your web site?

Explain that?

And also I am not discrediting anyone! I simply wanted to know how after I tried to get a serial from your web site I got a virus! I am not blaiming YOU. So fucking relax. If you got hacked then to bad, shit happens. I simply wanted to know if anyone else had this happen to them. And it seems this is so....

Don't get mad, I am just explaining that I got a virus after registering from your web site.

Maybe you need to take a class or two on Network Security and Viruses, then continue to support the Atari after you are educated.

No reason to jump on my shit because someone hacked into your system.

Tim

As most (all?) of the new virus fake the sender address, it's very
unlikely that he's the sender. See below for the real reason he couldn't
have sent it out.

<Snip>

>What's your side of this affair, was it a virus infection on your system. If
>these were genuine key updates perhaps you could zip and attach them.

His side in this is really quite simple. Robert is using a Mac and is
immune to all Windows viruses, so he couldn't have sent out those
viruses with the system he's using to the complainants, who are using
Windows.

Unless you received a Mac virus from Robert, which wouldn't have any
effect on your Linux system, he hasn't sent you a virus. If you received
a Windows virus, the From: header has been forged to look like it was
sent by Robert.

comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace,pdx.forsale

I've just updated 5 of my Atari Catalogs covering Games/Software, Books/ References and Hardware/Accessories for Classic Atari 8 Bit and Atari ST Computer Lines! I've sold some and added some like DooM for the Jaguar! http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/shipping.htm How I can save you Money! http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

3631. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.st
Date: 2003-06-13 02:14:54 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0306121912350.30144-100000@shell1.aracnet.com>
Source record: 26558

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at

http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

>psychic?

They don't need to be. All they need to do is read a newsgroup where you have posted to, to get your address, and read one that Robert has posted to, to get his address. A quick Google shows which groups you have posted to, and where Robert has posted. This means it could be anyone with an interest in Atari (both you and Robert have posted to Atari groups) and Commodore (Robert doesn't appear to have posted to any Commodore groups) hardware. It's also possible that you and Robert may have had been in the address book of the infected system that sent out the virus.

<Snip>

>Well how did I get a virus then? Spoofing a reply for a keyfile for my
>DOIT030 request on your web site?
>
>Explain that?

Do you remember the name of the virus you received? If you do, go and look up just how it works. Since you mentioned the .SCR extender, it's probably one of the Klez variants. Since it's most likely to be Klez.H which is still doing the rounds[0], here's some info about it:

<URL:http://securityresponse.symantec.com/avcenter/venc/data/w32.klez.h@mm.html>

>And also I am not discrediting anyone! I simply wanted to know how after I
>tried to get a serial from your web site I got a virus!

Luck of the draw. The virus decided to pick your address, and Roberts, at just the right time for you to say "I got it from you because I mailed you and this came back with your address as the sender"

>I am not blaiming YOU. So fucking relax. If you got hacked then to
>bad, shit happens.

You aren't going to get a Windows virus sent by a web server running on a UNIX system, which is where the www.doitarchive.de site is hosted.

Here's what the server identifies itself as:

```
Server: Apache/1.3.26 (Unix) mod_script
Vary: Host
Last-Modified: Tue, 03 Jun 2003 16:22:33 GMT
ETag: "a600bd-6ff-3edccb49"
Accept-Ranges: bytes
Content-Length: 1791
Connection: close
Content-Type: text/html
```

>I simply wanted to know if anyone else had this happen to them. And it
>seems this is so....

The number of viruses, worms and/or trojans I've received where the sender address in the headers was the real sender is so small I could count them using less than 1 finger. In other words, I've never received one where the real senders address was in the headers.

[0] It is an old worm that, for some reason, is still about. The hole it uses to execute was patched some time ago and, by now, there should be no anti-viral software that doesn't pick it up.

Regards,
David Bolt

My guess, looking at the URL given in another post, is that the data is
written to the port, after 0.5us strobe goes low for 1us and the data is
valid for maybe another 0.5us[0]

> It takes 44 clock cycles for a standard 68000

>
> On an 8MHz ST, that's 5.5 microseconds gone
>immediately.

And it'd probably take upto 200 clocks to get to raising BUSY, or about
25us. If that is about the timings required, it would explain why I
could never exceed 32kB/s with ParCP.

> So I'm thinking that we can't use an interrupt
>to read the port, and even polling on an 8MHz ST
>will be too slow for a sender with minimum timing.

It should be possible, but not at the absolute. There's an
implementation of PLIP for MiNT, ParCP and I've a printer port sound

sampler cartridge somewhere. Since I know the latter 2 work, it should be possible.

It's also a good reason for using a much slower machine as the source as it's very unlikely that one slower than, or even about the same speed as, an ST would be able to get the data out and match the minimum specs.

[0] I picked 0.5us because TTL-LS usually has a propagation delay of around 250ns and twice that should cover a single gate and rise/fall times.

Regards,
David Bolt

After timing just how long it takes to transfer 200kB using my old Pentium system, it looks like it takes quite a bit longer than 1.5us per byte. With the BUSY held low, the transfer time was just short of 46us per byte, or almost 370 clock cycles.

> It takes 44 clock cycles for a standard 68000
>to respond to an interrupt, including time to fetch the

But the real-world figures I have show that that still leaves 40us to set BUSY high. I guess that during some other interrupts, there may be a large delay that may mean it is unable to do so, but those would have to be very few and far between, and probably non-existent. Any regular interrupt that hogged the system for 40us, or more, would make the system so sluggish as to be virtually unusable.

> So I'm thinking that we can't use an interrupt
>to read the port, and even polling on an 8MHz ST
>will be too slow for a sender with minimum timing.

For the minimum, I agree that the ST would be too slow. However, that's the minimum timing, and my experiments show it should be possible to do. Getting it done is a different matter though.

David Bolt

It's supposed to, but can't say for certain. The way I figured it was
that since the MFP didn't actually trigger the interrupt, setting the
bit won't cause anything to happen except for stopping the MFP from
responding to any other interrupts, including a monochrome detect
interrupt. At the end of my routine, clearing the required bit, both
monochrome detect and the BUSY interrupt, re-enabled all the interrupts.

It was used it as a precaution but I've removed it since there didn't
appear to be any noticeable difference with it present.

After unrolling the functions, stripping out the extraneous instructions
and using bset/bclr instead of the and/or combinations, even with the
debugging info left by GenST the app is just 1020 bytes. Turn off the
debugging info and it's down to 670 bytes, 52 bytes more than previous
version.

It's in there, just a couple of instructions before the move.b.

That's probably because most of the spoolers seem to use the 200Hz timer interrupt, which would make them very slow. Even sending 10 at a time would still be a quite slow 2000 bytes/sec. This would probably be okay for a slow/old printer, it'd be almost unbearable for the newer/high speed printers.

<Big snip>

>> I think I'll put this pair of apps aside and just write one that
>> specifically reads direct from the port without any buffering.
>
> Polling might be much faster.

It is much faster. The polling loop takes 4 instructions:

```
waiting1
cmp.l (a2),d7 * waited for 30 secs yet?
blt.s exit1 * yes, exit

btst #0,(a1) * is "STROBE" low?
bne.s waiting1 * no, loop
```

a1=$fffffa01
a2=$000004ba
d7=whatever (a2) returned + 60000, equivalent to 30 seconds.

As soon as STROBE tests as low, control drops out of the loop and the next bit of code raises the BUSY line before reading the byte. However, even with this extra speed, it's still not working correctly. Since I've only had the chance to do a couple of very short test runs after coding the routines[0], and not much chance to do a thorough debugging I don't know what's wrong at the moment.

Just in case you are interested, I've archived the code[1] at:

<URL:http://www.my-ste.demon.co.uk/files/frompara.zip>

[0] A hard drive failure on my main system and the resultant data recovery exercise[2], re-install of Windows and the apps, have taken up most of my free time.

[1] There's supposed to be a GFA Basic program that calls the read_bytes function but I haven't written that quite yet.

[2] No I didn't have a recent backup so needed to get as much data off the drive as I could. XP wouldn't start with the bad drive, but I managed to retrieve most[3] of it using "Linux on a Business Card" that I had downloaded while suffering an over-abundance of curiosity.

[3] Less than 4Mb lost, from over 10Gb. Now to start backing up the
stuff before I have to go through this all over again.

David Bolt

What the fuck?!

Jesus christ, I do this on a daily basis and I have to deal with enough
crap from repugnant little shitheads like you telling ME that MY network
is virused, but I like to think I escape it on the newsgroups. So much "I
got a virus from your address, it's you!". And i have to respond, "I run
over 100 servers, I know what I'm talking about, it's NOT us, it's people
who have our support address in their outlook addressbooks. They don't
listen! You were told in plain english:

Fact: Robert Shaffner uses MacOS
Fact: This virus sounds like Klez
Fact: MacOS and Klez DON'T PLAY WELL.

I sincerely apologize for my language, but you should be pistol whipped if you cause Robert Shaffner to stop his fine work. And to others who are easily offended.. just let me know and I'll shut up ;-)

David thanks for the explaination. I never insinuated that Robert sent it to me directly, I figured someone must of hacked his server to get the names and e-mails of people that registered for the serial. Then the hacker went from there. The persons that do that clearly need a life.

Thanks for the good info.

Tim

Dude go get laid and come back. Ok feel better now? I wasn't talking to your dumb ass. And I NEVER said that Robert sent me the email with the virus. All I can think up at the moment is that someone hacked his server and got some names/emails of people that registered and then took it upon themselves to send a virus. I never said Robert did that! Look at who my reply is to then try to fucking relax a little. I also have to deal with shit heads like you all the fucking time and it pisses me off. Don't you hate it when you explain one thing and people think you said something else? ;)

Well all I know is that I did not say he sent a virus. Read the other
threads... All I know is that my registration info like my full name and
email got into someone's hands and they sent me a virus descised as a
keyfile for DOITF030...

Sleep well boys.

Does European Shareware have a US arm?

In any case I recommend that you download the English patch files from the
web site and check the hypertext carefully, as there are a couple of issues
regarding the use of commas and decimal points as number separators etc.

MagxDesk is available in the MagiC 6.20 update archive BTW, the MagiCMac
configuration program is a separate archive.

In any case DDP Translations recommend using jinnee for its ease of use and
access to the Mac OS side.

Seem to be more and more around these days.

Maybe us Atari supporters should set up a mailing list on Yahoo or where ever, and leave this newsgroup to people who would rather spend their online time venting their spleen or using bad language.

Oh geez! Alright, let's take this a step further... we post Atari
catalogs and magazines all the time. The company and publishers are long
gone.

What is the difference?

Why do people have to give flack for everything that goes on this list?
Post the catalogs, and if the people who have whatever is left of Toad
complains, they will ask for a cease and decist, and at which point he will
take them down.

No big...

Laters,

Doctor Clu

X Former uses some kind of JIT and it does not suit 030 caches well, try
with caches disabled.

Well, I have nothing to do with making music of my own but I recently purchased a Steinberg/Soundpool Falcon Digital Interface, which showed to work great for example with Aniplayer when replaying some mp3 directly from my Falcon to my Minidisc Hifi Deck through an optical cable. (BTW, after so many years I am still much more fond of minidiscs than CDs when it comes to manipulating music!).

I also got the Cubase Clock which I can plug instead of the Digital interface and gives a DSP sound clock of 44.1 kHz instead of the original stock 49.9kHz that requires signal resampling when playing mp3 for example.

Since I got no driver nor documentation about the interface, I wondered if there were some driver or control panel to steer the soundpool (other external frequencies for the DSP for example) or if everything is to be used "as is"

thxs,
Fred

I have to give you credit for a well worded reply ;-)
Okay so consider it's Klez. Someone has to have.
A: Your address
B: robert's address and/or C: the serial number email with which to rip
the topic from.

Presumably, it's likely that there's someone who trolls these groups
adding addresses to mailing lists, who also got this virus, who also got a
doitf030 serial. Perhaps also if the subject line doesn't state as such,
they may not have the DOITF030 serial at all. There's also worms that
scan other places on the machine and hijack email addresses from text
files. Some news readers store a cache as text files.

To put it simple, the likelihood of someone with Windows (and this worm)
having you and Robert's Address on their machine is highly likely.
The prospect of Robert's Mac sending you the virus seems highly unlikely.
The prospect of a virus author or some mischievous fiend hacking Robert's
machine to get a few emails addresses to send a widely distributed worm to
that most likely commonly forges headers is INSANE.
The prospect of you being an initial target for the initial sending of a
virus (hence someone is purposefully trying to inject the worm to you
first and to let it circulate) is extraodinarily unlikely. I guess I just
got a little worked up because I've seen the DOIT archives and their THICK
with useful stuff.

If you want clarity, write down the virus name and do a search for it in a
virus info database. Read how it works, it sounds to me like you're not
getting it. It's probably merely coincidence that you put your address on
there and then received virus emails back - unless you're insane like I
used to be and use a different email address for every single little
thing.

I understand your frustration about not receiving the serial, I've been there but you should chill too. A lot of people take community support of these machines VERY seriously, and a lot of stragglers are only hanging by a thread. We don't want to lose out.

PS: I am not a dumb ass nor a shit head... I just play one on tv.

God Damn it. Where in the my above text does it say anything about the author sending me a virus? I am simply saying that is is quite sad that a virus gets to me before the keyfile, regardless who sent it.

Tim

Well according to some, we that got infected are morons, and
registering on the DOITF030 web site had nothing to do with it.

Isn't that great. Well good thing us morons keep our AV up to date.

Hi all!

Just a quick message to remind you that the JagFest UK event is happening
this weekend, in Rochester, Kent.

See the website http://www.1632systems.co.uk/html pages/Shows/Jagfest.htm
for more details.

I am attending for the Cheshunt Computer Club, with Derryck Croker and
Peter West of DDP.

So if you live in the South of England, you should see if you can attend!
Come and say hello! :-)

Cheers,

James

Hi

I've downloaded some *.ST files (Games)
I've got an Atari STFM
I've got some Double Sided Double Density disks.
I'd like to turn the *.STs into disks to play on my Atari.

Problems:
Makedisk is DOS and does not run in winXP. I can't boot to DOS because
my XP hard disk is NTFS.
I've got a computer running mandrake linux, but when I click on
Makedisk it does nothing so I guess it's incompatible. (total linux
newbie btw)

How can I use makedisk to turn my *.STs into real disks?

Thanks
Toby

Burn all the .ST images you want to convert to CD-R. Boot to a DOS disk
w/CD-ROM drivers and use STDISK to convert the images to disk! ;)

You might have to to a 720k image FIRST then the other larger ones up to
830k, as I have found that if you try to to a larger one first it will fail,
but doing the 720k one first will do the trick!

If he uses a Mac, then there's no way that I know of that his computer could have spread the PC-based virus. However, how is it that only those of us who've actually registered for a key are the ones to receive the virus? I received it, as well. Fortunately I currently use my Mac to read e-mail, so it didn't affect my system at all. So it's quite odd that the e-mail was sent only to people who've registered, posing as the registration key, when it didn't originate with Robert's machine. Any ideas how this might happen? How to prevent it?

No one ever agreed with me so i guess that makes it OK.

As all you assholes tell me, check the headers first, if my name is in it
then hit delete.

Would you like fries with that?.

I received it as wenn, and did *not* register with Robert.

Probably someone else who did register got infected, and the virus just
picked a random email text from that person and sent it to lots of email
addresses from his address book.

>it didn't affect my system at all. So it's quite odd that the e-mail was

>it didn't originate with Robert's machine. Any ideas how this might happen?

The only way to be sure is to trace back the source of the mail. The
From:-Header is absolutely worthless in that respect - you need to trace
back the Received:-Headers, see which are original and which are fake, and
contact the ISP where the last non-faked header originates - he should have
the needed information in his mail server's log files.

Ok. Thanks for the info. The only cases I've heard of until now, were people who've registered. I guess this blows that theory!

Maybe *you* should take a class or two - you should first find out where the
virus really came from, before you accuse random persons who appear in
(probably faked) From:-Headers of sending you virii.

As long as you are clueless regarding the virus source, you might at least
be polite when talking to the persons you suspect.

Even if it affected only people who registered, that would just be a very
weak hint at the source - better investigate first before publicly accusing
someone. A polite, private email would be better in any case.

Sure? Do you have any evidence for that?

The From:-Header is easily forged (many virii do that). So you did trace
back the Received:-Lines to Robert's ISP and got confirmation the mail was
really sent by him?

3684. Re: Configuring "Superboot"

Newsgroup: comp.sys.atari.st
Date: 2003-06-13 19:49:17 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <bcd9rt$6g3$1@reader1.panix.com>
Source record: 26464

One thought here. There are at least three versions of xcontrol, and two of zcontrol. Set up separate folders for CPX files for two different file selectors, such as CPX_X, CPX_Z, and use superboot to load one control panel or the other.

My machine is TOS and MiNT, and some of the CPX files I need in TOS will keep the file selector from loading in MiNT. So, I use two different file selector programs, with different source folders, and superboot to load one or the other.

Jim

Hallvard Tangeraas <Hallvard@despammed.com> writes:

: I'm having trouble configuring some parameters of the boot-selector
: "Superboot" (http://www.notator.org/html/software.html#superboot).

: I want to add the ability to select/deselect CPX modules as well, but I
: can't quote figure out what to enter in the "Configure 'other' file
: selections" option (you'll see it in the main screen of SuperBoot).

: According to the help button in the program, files are renamed with an
: "X" at the end of the extension when deselected (which isn't what we
: want with the ".CPX" as this actually means it's active), and with "type
: 2" files it says that only one file can be active at a time (which is no
: good either, because I usually want more than just one CPX module to be
: active).
: So, what do I do?

: or..... isn't it possible to have SuperBoot rename a file with anything
: other than "X" at the end when *deselected*?

USR...good modems! I'm not sure if they're still available but the one
I have is accessable through AT commands like the old Supra (now Diamond
Multimedia which changed to very limited AT command access...maby the PC
software that comes with it provides a different more). Anyway, damn bolts
here are supercharged!!! The scarry part is the sky overhead could be blue
but you can get zapped from a cloud 10 miles away !!! I think Florida is
the "shark bite capital" too ! I feel like I need a bunker (Sadam's would
be nice :)

>Hi Tim

Hello everyone,

>You're not alone, i registered here years ago and forgot all about it, this
>week i get 2 attacks from this site, thankfully my VK squished it.

I think Robert has much more to do than wasting his time making
others lose theirs.
I think too, and I'm quite sure of this, that you were sent the
mail containing the virus by some fucking person who grabbed both
your adress and robert's one in this NG.
We had to face the same kind of attack a few weeks ago in fcsa :
I received a mail from someone I actually knew, but what made me
doubt is that the sender's adress was an antispam one - and he
would never had used it if he really had written to me!
In the same time, another guy received a mail supposedly sent by
me - but I did never send anything to him.
As you can imagine, both contained a virus, but as they are made
for PCs, my Falcon wasn't altered. Sadly for the guy who received
from supposingly me, he used a PC... and said very bad things about
me on the NG, just the way you're doing for Robert.
And, recently, I received 2 mails from Micro$oft : in fact, they
come from someone that use theyr adress, and the link leads to a
page that pretty looks like Mico$oft's, with lots of information
and links which are viruses' :-(
So, before you bash Robert - or anyone else, think twice : it would
be very easy for someone misintentioned to use your - or everyone
else's - adress to ruin your reputation :-(

Yeah well I wasn't too worried until I finally got a reply, and it was a freaking Virus! I was like Damn!! Couldn't believe it. I knew right off it wasn't the Author doing that, I assumed his site or computer got infected, wasn't sure. If he is on a Mac then it wasn't him for sure. Heck I have Amigas that I use online all the time and I don't have to worry about those pesty PC viruses.

Well I'll tell you right now I am a hardcore Amiga AND Atari guy, so I know what you mean. I just hate it when our "No so good English speaking" friends jump the gun sometimes. I never even attacked Robert on this, and he got a little bent out of shape. I was just trying to see of others got the virus too, or if I was alone. I appreciate his work (even though I have yet to see it!) LOL And never wanted to piss people off. But it looks like more than a few got a virus. I just hope the perpetrator gets a life and just leaves us Atari guys alone! ;)

Got to admit that seeing 3 adverts today was a little OTT, one yes but
3 at a time is pushing the boat a tad..

See it's guys like you that really pisses me off! I never said he (or others here) sent me the virus! I didn't point the finger to anyone for that matter. Read the other posts as to why I KNOW that all this (NOT THE FUCKING VIRUS TO ALL THE ID10T Errors out there) originated from HIS web site. I already have taken classes, maybe you need to. Or retake them if you have. Oh maybe just get a GED while you are at it. ;)

Hahaaha this is fun.

>I click on the link and my Antivirus alerts me that it is a virus!
>Thankfully I didn't get infected!
>
>I am thinking someone hacked into the site to get my info?

It looks like it - I got one as well, even though I had bought a
CD version some time ago. Mine had the header:

From support@draco.stochastik.rwth-aachen.de Sat Jun 7 06:58:26 2003
Subject: DOIT-Archiv Homepage

and the file was "Kaavi.01.xls.scr"

I reported it to Robert Schaffer, the author and he confirms it's
not from him. Of course, on an Atari the virus file does nothing!

It would be interesting to know how many people got this virus who had
not asked Robert for a key, and how many who had. That might help to
check whether someone had managed to hack Robert's database, or just
sent it out randomly to Atari usenet users.

Regards, /Peter/

3699. Re: DOITF030 Virus!!!??

Source record: 26480

Hi!

> It would be interesting to know how many people got this virus who had
> *not* asked Robert for a key, and how many who had. That might help to
> check whether someone had managed to hack Robert's database, or just
> sent it out randomly to Atari usenet users.

I also received the virus and had registered twice :
- first unsuccessfully about two years ago (i got kind of angry against
the key protected archive i could not open),
- second in april of this year where I quickly and successfully got a
key. I am very thankful to Robert for having maintained such an archive
which I currently use up to several times a week !

Now, back to the subject, the newsgroups are the only place where I ever
used an antispam address which appears on the infected email as following :

-----Message d'origine-----
De : Robert Schaffner [mailto:support@draco.stochastik.rwth-aachen.de]
Envoyï¿½ : samedi 7 juin 2003 07:58
ï¿½ : fpecourt@invalid.ifrance.com
Objet : DOIT-Archiv Homepage

It is more than obvious that the newsgroup got scanned and hacked by
someone who must also visit this newsgroup, isn't it ?

Fred

I'm sure he has, but quite often people unwittingly fall vitim to this sort of thing, the obvious answer is to approach the apparent sender, if only that he can formulate a defence against the idot who instigated it. I've much too much respect for him to assume he's delibratley, if at all launched a Virus attack.

> I think too, and I'm quite sure of this, that you were sent the

This would be a pity but I do understand your point of view. Too many freaking guys are spoiling this newsgroup with useless talk nowadays. This group was once a very good and pleasant one, now...

I find it very sad the good guys are leaving this group because a minority of the posters doesn't know how to behave.

CU,
Martin

That shoudlnt work for an MSA disk, because its compressed. The .ST files
will work fine whether you use rawrite or just "dd", but make sure the
floppy is formatted properly to the correct capacity first.

There is no driver required for the FDI, though you should be aware that
there is a little program called FDI.PRG that initialises the FDI at boot
up, because this little job is not done by Cubase Audio. You dont need this
program if youre using Soundpool's Audiotracker as it will initalise the FDI
properly when it starts.

FDI's (and only the later not the older ones) provide two clocks itself,
they are for 44Khz and 48Khz, though you only need these if the FDI isnt

receiving a clock from the DAT/CD/MD player etc, and you are recording from the Falcons MIC socket.

I dont believe any manual came with the FDI, as its just meant to be plugged in and used.

It seems not. :-(

In "other" file selections, I set up a "type 1" type with ".CPZ" extender.
It works perfectly, except that the display is inverted, compared to ACC
files or auto folder files.

Hm, 14 MB ST RAM??

I have been playing around some with Debian Woody and then bring it up to
"Testing" level via apt and a nullmodem cable on my TT. It has 4 MB ST
and 32 MB TT RAM. This is with a ET4000 graphics card. 1024*768*2 works
fine but in colour the palette seems mixed up.

Never got X running with or without the card. But I've never tried
something like this before so I'm a total newbie on Linux. Actually the
closest I've been to Linux before is puttning MINTNP.PRG in the
autofolder under Geneva :-)

Latest stable Debian definitely runs on less than 14 MB ST RAM in text
mode.

He has got my email address for quite some time now and I have not yet
received any mails from him with any form of advertising... Just rather
quick responses on my qestions etc...

Afaik he gets online with a terminal emulator on a MegaST using Pine etc
at his provider's shell. I don't think that's an ideal situation for
being a spammer. This may also explain why he does not participate more
in this group. It can get rather expensive if you pay buy the minute and
are online both when reading and _writing_ messages.

What for? You are spamming[1] someone who is not infected and can do nothing
about the mails, only because he is in the forged From:-Address of a mail he
did not send?

>I'm confidant of that, but we must wonder why someone would attack someone
>like Robert to start with?.

Its not an attack but a virus/worm - they are not targeted at anyone
special.

cu
Michael

[1] Yes - if enough people complain to the people who the faked From-address
belongs to, this can get quite annoying and might be considered spam.

@draco.stochastik.rwth-aachen.de is where one of my (old, now unused)
addresses lives - I got the mail, too, on that machine. However, The address
support@draco... does not exist - now can we please drop discussing these
useless information and look at the *real* headers, the ones not forged by
the virus, please?

>It would be interesting to know how many people got this virus who had
>*not* asked Robert for a key, and how many who had. That might help to
>check whether someone had managed to hack Robert's database, or just
>sent it out randomly to Atari usenet users.

It won't help. Go read the virus FAQs on the behaviour of this virus, then
you will know that discussing faked from:-Headers is useless. There is
simply no need to hack anything at Roberts side - it is sufficient that
anyone out there has your mail address in their in/outbox *and* received a
Mail from Robert - that makes for a lot of people out there. If One of them
gets infected, the virus is able to send you the mail you got.

M>>Unfortunately you need 14MB ST-RAM for the latest Debian distribution,
M>Hm, 14 MB ST RAM??

Oh, seems my posting wasn't that helpful. :-)
I think I have to clarify some things.

The current debian "woody" doesn't run from FAST RAM on my afterburner equipped falcon (don't know about Hades or Milan with mc68040 cpu). Due to this fact it has to be started from ST RAM. Unfortunately the provided ramdisk needs more than 4 MB (ST RAM) and that means 14MB on my falcon. :-)

M>Latest stable Debian definitely runs on less than 14 MB ST RAM in text
M>mode.

Of course it does. It even works in graphics mode (X) on a TT or falcon with NOVA graphics card but only on those machines that have a 68030 cpu and 6888x fpu.

On this machines I have to admit X11 is painfully slow.

I hope that it is now clearer what I first wanted to say.

Conclusion:

On a 68030 equipped ATARI linux/m68k runs fine even if you do not have 14 meg of ST RAM but with X11 quite slowly.

On an afterburner equipped falcon it needs 14 meg ST RAM.

On a Hades or a Milan with 68040/68060 I don't know. :-)

Frank

Yeah, that was what I was about to suggest before I read this. Basically, you are fooling Superboot into thinking the file's actual extender should be CPZ, and then you do the opposite of what you intend - select the ones you *don't* want to run, and deselect the ones you *do* want to run. Kinda wierd, but it should work fine.

There are programs for it. If you use FreeMiNT there is a special system call for it.

You could use EmuXL too (works ok on 030).

3734. Atari TT030 compatibility page (Memory / Video / Ethernet)

Newsgroup: comp.sys.atari.st
Date: 2003-06-14 21:03:03 UTC
From: Doctor Clu <drclu@swbell.net>
Message-ID: <BB10F86D.2F56%drclu@swbell.net>
Source record: 26414

If all goes well I will have a working TT030 again... yah!

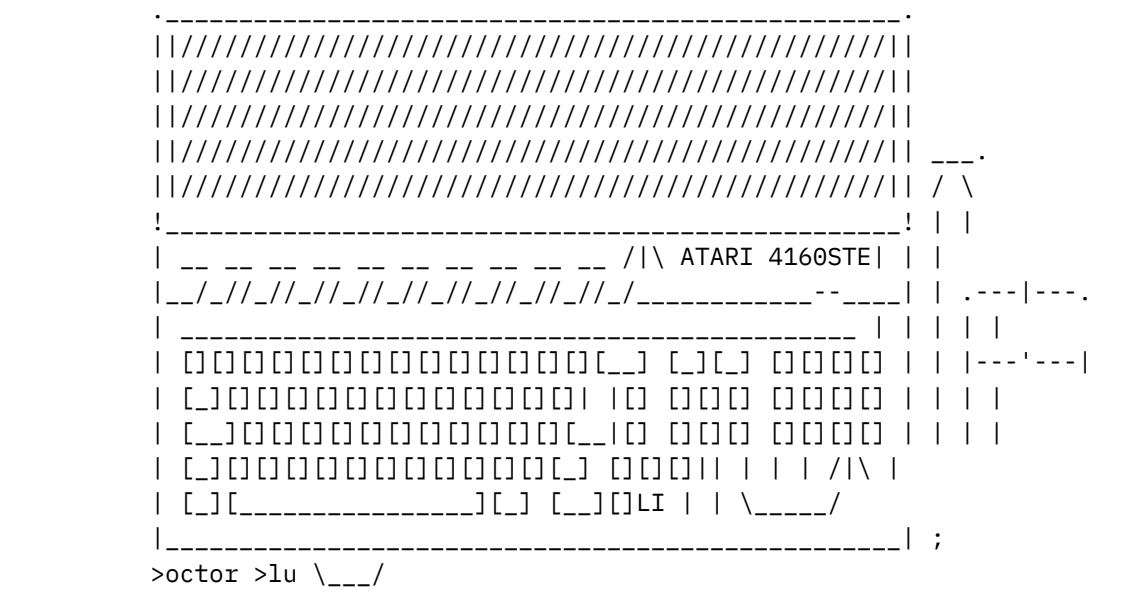
So I'm starting off with 4 meg (maybe). What are some good memory options out there that I can buy?

I understand various video cards can be used. Which ones work? Do you have to download special drivers and where?

And finally, Ethernet and making the TT a part of a network (I have DSL at home) would be great. What options are out there?

Thanks,

(My current machine and the computer the TT030 will be replacing... (anyone got a ASCII pic of a TT030?) :)



(Original art: valkyrie http://www.ascii-art.de/ascii/ab/atari.txt)

3736. Who is Ben Smith? [Was: Do as I say, not as I do]

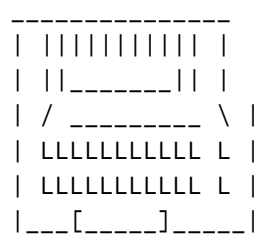
Newsgroup: comp.sys.atari.st
Date: 2003-06-15 03:22:26 UTC
From: Doctor Clu <drclu@swbell.net>
Message-ID: <BB115158.3006%drclu@swbell.net>
Source record: 26416
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Can someone answer me on who Ben Smith is?

Honestly I am surprised, maybe somewhat saddened, by the amount of
flamage that has gone on here. Normally I would expect this of the ST
newsgroups, but not so much the 8-bit groups.

So if someone can tell me a factual account of what Ben Smith has done
and who he is to get me up to speed, I would appreciate it.

Thanks,



Art : http://www.faqs.org/faqs/atari-8-bit/faq/

Hi wrinkles and Loo-Spoon-Ian

Here's a paragraph I've just stolen from the last page of Windows XP
(magazine)

Entitled.

The Brand is back

Quintessential 80's brand
Atari has made a
triumphant return to the
games industry. The
company achieved cult
status with games like
pong, and Infogrames
have relaunched it as a
games label and adopted
it a company name

>fpu.

I never got either Potato or Woody to work with X on my TT with ET4000.
Also tried with TT-medium resolution without luck. "No Screens found"...

I had hoped it would be easier to get it running on a TT compared to
setting X up on pc hardware because the TT internal video is "fixed" so
no need to add support for various cards, etc.

What's the trick to get X running on a TT??

As I got textmode running with the ET4000 I'm aware of the external video
parameters in the bootstra.prg .

>On this machines I have to admit X11 is painfully slow.

I suppose so... Anyway I would ideally want X running at 1024*768 at 256
colours via ET4000 and my LCD monitor.

It would be a cool thing to show at the Nordic Atari Show this summer...
Not usable, perhaps, but cool :-)

>I hope that it is now clearer what I first wanted to say.

Yes, but unfortunately I have no answers...

3743. Re: BBB complaint against www.Vernalelm.com

Newsgroup: comp.sys.atari.st
Date: 2003-06-15 13:21:26 UTC
From: barnes@divide.net
Message-ID: <b33eb69f.0306150521.39052c6e@posting.google.com>
Source record: 26424
Cross-posted to: comp.sys.amiga.marketplace,comp.sys.atari.st

As a followup to my post on VernalElm, I have this to add:
Thirty-three days after winning on eBay and paying for a "Full"
Motorola XC68060RC50 chip, a package from VernalElm finally arrived!
This sense of closure was completely offset, however, when I opened
the anti-static bag and found an XC68EC060RC50 chip instead! Although
there have been previous discussions that EC chips may sometimes be
full versions, my A4000T indicates that the MMU is missing from this
chip. One of the two British eBayers I contacted earlier also says
that his chip is the EC version, so there seems to be a pattern here.
Furthermore, I paid extra to have the chip insured during transit but
this was not done (83 cents 1st class postage in a new post-consumer
materials cushion-mailer. For this I previously paid $4 for
shipping/handling, $1 for insurance!). The anti-static bag was
heat-sealed, but the chip itself was set into a thin piece of
styrofoam (not heavy foam as is the norm) and several pins were bent.
It obviously wasn't a new/unused chip, but of course it was never
advertised as such, so no complaint in that regard. On the two
occasions that the owner of VernalElm (presumably, Ben Berkowitz)
responded to my emails, he was very polite and offered plausible
explanations for the delay in shipping (i.e., unexpected office
problems and communication snafus in the mail room). Given the sum
total of my frustrating experience, however, I now wonder if he is
just a very clever lad, who knows how to take advantage of human
nature. If this is the case, then I congratulate him for being able to
use the system to con me (and possibly others) out of a few dollars.
If it's not the case, then I apologize, but I can't say that he
appears to be a very good businessman. At this point, however, I have
left negative feedback for the seller on eBay, and am investigating
other means of redress. Regards from Colorado, George

Glad to hear that you at least got something from him.

On Sun, 15 Jun 2003, George Barnes wrote:

> styrofoam (not heavy foam as is the norm) and several pins were bent.

That sounds a lot like the chip that I sent back to him. Not sure of course, but then again, what else would he do with the EC 68060 I returned to him?

Also, don't believe him about 'mailroom' issues. It's just one person, operating out of his house at 239 Front St. New Haven.

Eric

This looks like the Mail originated in Finnland and was then passed on to
outblaze (your ISP?).

Now since I think Robert lives in Germany, and the originating IP address
seems to be

174.2.142.194.in-addr.arpa. 21600 IN PTR user-roi2-174.dial.inet.fi.

which looks like a dialup-account in Finnland, I would really like to see
any hint why you think Robert or any of his machines has anything to do with
this - unless you had contect with Sonera in Finnland and they gave you that
information, which I doubt because you would have told us, right?

cu
Michael

As far as I am concerned though, the MMU is more important than the FPU.
But without either one as far as I can remember, you don't get the benefit
of the other with the CT60. I.e. A 68060 with MMU but no FPU will have
the MMU disabled. That could be vice versa, but either way around it, I
and several others clearly paid for a full version 060. However I am told
from several people who have bought from him overseas that he has shipped
mislabeled 060's that are sure enough 68060 fulls.

anyone done this with STs..we tried it today with a Facon and an ST (sans HD)..almost got there..the actual prg comes packed over three disks (or thats how I got it) so how does an ST without a HD manage it ? Do we have to swap disks through the game? We managed to get both options screens up..I was red, he was blue :)

I've manadged to make MidiLink, but it was a long time ago. I remember we had soe sync problems, ie. everything in the game menu should be done at the same time. The gameplay was ok. I did link for two STEs.

Well - just after replying to one of your posts, I also got a mail with a
virus in it - so what? By reporting "what happened", you imply a connection,
although you have nothing to back that up - you could have looked up easily
that there *is* no connection, and the whole thread would not have happened.

><Big snip>
>
>>> I think I'll put this pair of apps aside and just write one that
>>> specifically reads direct from the port without any buffering.

I've tried myself to write a GFA INLINE. The idea is to first allocate memory in GFA, pass the address to the INLINE and let the centronics interrupt execute code inside the INLINE and save data. Both pointers and data should then be easely accessed from the GFA code.

This should make it possible to write a nice looking GEM application around the code.

I have _very_ basic knowledge in Assembler programming so there may be a lot of severe errors in my code! I'm also going away for a few days tomorrow and have no time for testing it right now. Any comments (or tests) are wellcome!

Anyway, here is my attempt (with apologizes to those who prefer long meaningsless debates on what should be posted here or not...):

```
*GFA INLINE code for reading the parallel port

*On start adress to a buffer allocated in GFA on stack. Pointers
*in the buffer header are set in GFA

*Buffer organization:
buf_length equ 0 ;Length of buffer excl parameters
buf_writep equ 4 ;Pointer to next write position relative to buf_start
buf_start equ 8 ;Start of buffer memory

mfp_int equ 13 ;Initialize MFP interrupt
gemdos equ 1
super equ $20
xbios equ 14
psg equ $ff8800

move.l 4(sp),d0 ;Read buffer address from stack
move.l d0,buffer_adr ;Store buffer startaddress
```

```
*Install centronics interrupt
move.l #busy_int,-(sp)
move #0,-(sp)
move #mfp_int,-(sp)
trap #xbios
addq.l #8,sp

clr.l -(sp) ;To supervisor mode
move #super,-(sp)
trap #gemdos
addq.l #$6,sp
move.l d0,d3 ;Old ssp saved in d3

move #$2700,sr ;block interrupts

*Set parallel port for input
lea psg,a0 ;Sounchip address
move.b #7,(a0) ;Reg 7 select
move.b (a0),d0 ;Read register
bclr #7,d0 ;Port B as input
move.b d0,2(a0) ;Write register

*Set strobe (acting as not busy) low
move.b #14,(a0) ;Reg 14 select
move.b (a0),d0 ;Read register
and.b #$df,d0 ;Bit 5 controls strobe
move.b d0,2(a0) ;Write register

move #$2300,sr ;interrupts freed

move.l d3,-(sp) ;Return to user mode
move #super,-(sp)
trap #gemdos
addq.l #6,sp

rts ;Return to GFA

*Routine executed by centronics interrupt
busy_int move #$2700,sr ;block interrupts

*Set strobe (acting as busy) high
lea psg,a0 ;Sounchip address
move.b #14,(a0) ;Reg 14 select
move.b (a0),d0 ;Read register
or.b #$20,d0 ;Bit 5 controls strobe
move.b d0,2(a0) ;Write register

*Read incomming byte on parallel port to d1
move.b #15,(a0) ;Reg 15 select
move.b (a0),d1 ;Read data

lea buffer_adr,a1 ;Load buffer pointer

*Check if room in buffer
movea.l buf_writep(a1),a2 ;Get write position in buffer
```

```
movea.l a2,a3
cmpa.l buf_length(a1),a2 ;Room in buffer?
beq buf_ful

*Store incomming byte
adda.l a1,a2 ;Add buffer base address
move.b d1,buf_start(a2) ;Add start off buffer position and store d1

*Increment write position and save
addq.l #1,a3
move.l a3,buf_writep(a1)

*Set strobe (acting as not busy) low
buf_ful and.b #$df,d0 ;Bit 5 controls strobe
move.b d0,2(a0) ;Write register

move #$2300,sr ;interrupts freed

rts ;Return from interrupt

Thanks for your input Mark. Although the 3.1OS on my A4000T only showed the 060CPU and 060FPU when the VernalElm XC68EC060RC chip was installed into my CS MkII, I decided to try the 3.9OS and see what it would show. I was more than a bit surprized to discover that "Showconfig" then displayed the 060MMU as well. The bottom line being that I possibly do have a correct, although mislabeled, chip. I can't help but wonder why, though, VernalElm (in the midst of all of my other concerns), could not have pointed this discrepancy out ahead of time. Regards from Colorado, George

Hi wrinkles and Loo-Spoon-Ian

Here's a paragraph I've just stolen from the last page of Windows XP
(magazine)

Entitled.

The Brand is back

Quintessential 80's brand
Atari has made a
triumphant return to the
games industry. The
company achieved cult
status with games like
pong, and Infogrames
have relaunched it as a
games label and adopted
it a company name

> There are other ways to get a MSTe to run _after boottime_ than
> FAST.PRG...

Mega STe runs at 8MHz initially when it's boooting up. FAST.PRG (or any other of many utilities - even a floppy bootsector switcher exists) can be put first in the AUTO folder and it switches the MSTe to 16MHz so that it runs the AUTO folder programs at 16MHz.

Memory fails me, so I can't remember whether the Mega STe switches to 16MHz after TOS has initialised or after GEM has loaded or whether it's a NEWDESK.INF setting (certainly the cache setting is picked up in there, but I don't know about the 16MHz setting).

The reason for this 8MHz \ 16MHz arrangement is, as previously said, to retain compatibility for games. No other reason.

In answer to the question of why Cache on or off settings exist, some software refuses to work with it on. Specifically, the Migraph scanner will crash the computer with Cache set on. It will work happily at 16MHz with cache off.

To answer the last point of stupidity quoted here, a 16MHz Mega STe with cache off is only about 20% faster than running at 8MHz, because of bottlenecks elsewhere - maybe not even that much, but close. The processor is obviously twice as fast, but that doesn't mean anything in terms of real-world benchmarks.

> Time to put you back to my killfilter... Your post are mostly

Indeed. Sometimes it's easier just to resign the NG, like me.

3767. Boxes of FREE ST hardware and software

Newsgroup: comp.sys.atari.st
Date: 2003-06-16 03:17:51 UTC
From: dhess@adams.net
Message-ID: <ecf24074.0306151917.6a7a1627@posting.google.com>
Source record: 26348

Cleaning out my garage, and came across literally boxes full of Atari stuff. Couple of 1040 ST computers and monitors, lots of accessories, hard drives, "Happy" drive (remember those hotrods?), big box of software, just lots and lots of stuff. I think there are even a couple of 800 XL's in there, might even be an old 400. Anyway, it all worked last time we had it hooked up some years ago, and I kinda hate to think about how much money I spent on all that stuff! (But then, it did give me a jump start into computers before most people could spell it!) Here's the deal- I just can't stand to throw it away if there's anyone who could use it. Pay shipping, and it's all yours. Or, if you live close enough to Quincy, Illinois, come get it. (Quincy is about 2 hours north of St. Louis) E-mail me at
dhess@REMOVE_THIS_SPAM_BLOCKadams.net
Hope somebody can use it!

I have sadly come to realize that after countless games on five games systems, two computer platforms, and after making successful PC clones and a portable game system, all Atari is immediately noted for is PONG!

That's sad...

Oh yes, there was a green/red one wasn't there? Well, colour isn't
important to me, I just said "black" to help describe the joystick I
was imagining.

So, if your friend wants to sell it, you know what to do... !

Hi Hallvard,

You could always try to contact me to discuss the specification of
the program you want. I don't promise to code it but maybe it would
be easy enough to expand one of the tiny tools I've written for
my own use for similar tasks.

Gerhard

The only way is to select all the text that is to form a paragraph and then apply the reformat para command (CTRL-Z IIRC).

Everest has the unwelcome habit of truncating any line that exceeds 256 characters, so is not the program of choice in this case.

Yes, good point! And to strengthen that point: Bushnell's Atari was
already working on a 16-bit computer that was even more ahead of its
time than the ST. When the Tramiels took over, all the designs for this
machine were thrown away and the whole thing was started from scratch.

Why would Motorola mislabel chips? Either you have a chip that failed some
manufacturing test in the MMU and was thus sold as an EC, or Motorola was in
need of ECs so that they down-labeled some CPUs - *without testing* the MMU.
Testing complex parts like a MMU costs lots of time during manufacturing, and
so not testing part of the chip really makes it cheaper, even if it is the
same silicon. With the reduced test, it might even be that the device passes
at a faster speed grade.

So if the MMU is present in a chip labeled as 68EC060, most probably is was
either not tested or tested and failed - which you might not notice during
normal use at first.

Anyway, you got not what you paid for.

Wrong. There is a great connection. It wasn't just a random virus I got
after being on usenet, it was in reference to the DOITF030 registration! It
seemed, to me anyway, that it was more likely that I got the virus because I
registered for a key (REGARDLESS OF WHO SENT IT), than frequenting usenet on
an otherwise obsolete vintage outdated computer forum. It just seems more
ligical that If I register for a key on a site, and when I get a reply weeks
later with a virus, that it was due to the registering on the site. Why
would someone send a virus blindly to people who post to comp.sys. atari.*
with the fake reply of a DOITF030 keyfile, UNLESS they actually registered
for the key to begin with? This is not the case here, almost everyone that
got a virus, except one I think, said they registered for a key. Do you
see the connection now?

Basically, Ben Smith runs Bravo Sierra, an Atari dealer in the US. He has been posting advertisements on the ST and 8-Bit newsgroups, sometimes fairly often. This has made a number of people upset. As a concession, he has agreed to always begin his subject lines with [ADV], so that people could put this into a kill file, or ignore them, if they don't want to see the ads. Unfortunately, this hasn't been enough for some. Some of these people have simply discussed why these posts shouldn't be allowed in the newsgroup, while others have taken a more extreme, trollish, profane approach, slandering Ben and anyone who replies to their posts. They also send threatening hate-mail to anyone who attempts to reason with them in order to stop their pointless profanity. So that's the basic idea of what's gone on.

However, that one person completely invalidates that connection, as there is obviously something different going on than what you originally suspected. I too thought there might be a connection until I saw the reply from the person who never registered for a key. That means there is no connection, other than this newsgroup or someone else's mailbox. Back to your question as to why anyone would blindly send a virus? Well, aren't most virii sent blindly? This is in fact more clearly directed than most others I've seen and heard about. If it wasn't simply a randomly chosen e-mail to which a virus was attached, then it's probably reasonable to assume, especially from someone who doesn't know this community well, that even if not everyone in the group has registered for a key, a fair number have. That means that the likelyhood of at least some receiving and opening the virus is very good.

If you're talking about the Atari version, late summer, but they didn't mentioned the year of the forseeing release.
The hightest priority goes to the Mac OS X version of Papyrus which is forseen at the end of june.

HT>
HT>4) Preferably with a nice, intuitive graphic interface
HT>
HT>5) easy to use!!!

Yes! Well, not exactly a boot selector, but why bother with installing and configuring such a program?

All you've got to do is copy the AUTO-folder and Accessories to different partitions, configure them (including local copies of assign.sys, and altering the sequence) there and then simply press the appropriate drive letter upon boot to select the desired boot configuration.

With HDDRIVER without MagiC, there may be no accessories present on C: in order to enable loading them from elsewhere, but in all other cases you may boot the entire system from any drive available.

I don't need to this is a public forum. Well if he likes to jump on peoples shit then he will get a piece of my mind. Simple as that. Don't care who he is or how useful he is to the group! He needs to redirect his supressed feeling to the original poster of the thread not me. I am fucking sick of this shit. I, like all of you, am an Atari user from way back and am in here for my love the machine, and also do not like to see the kind of crap that has been posted here!!!!! Now including yours. I agree that it is best to ignore that asswipe but it just pissed me off and I had to say something.

> This time you've gone over the edge.
> Unlike you and some other cowards who take refuge behind anomynous

> postings?

My real purpose is to be a Atari user and contributer to the Atari community. To read about and help others about Atari Computers NOT read about others supressed anger and backlash. That is why I am here. I have been a Atari user since 1984. Gone from the Atari 800XL all the way through to the Atari Falcon030. I am here to read about and contrubute about Atari computers. NOT to get flamed on because I didn't use my News Reader correctly!!!

Because I did not snip the "crap" that I replied to does not warrant the rude reply he made to me. Even though I should of, and will do that next time. I really didn't even think about it. He is right though I should of done that. But he could of been a little more tactful about it. Don't you agree? Or is this the theme of this "nice" group to be rude to people and not be polite????

> You and your friends are the only ones who should leave this group. I and
> probably the most of the readers won't miss you at all.

What friends are you talking about? The ones that won't take your shit when you are rude to them? If that's the way things are going to be then a lot of us will leave and all you rude bastards can hang out and bash each other.

And do not even think of including me in the same context or group as the Anonymous asswipe that has been posting his crap on here!!!!!!!!!!!!!!!!!! He is not my mate. I am just a Atari user taking a stand when someone is being rude to me. Period.

So get off your High Horse and relax. Maybe you should get off that PC and play a game of Pacman on your Atari. If you even have one ;)

Tim

Well the thing you guys need to realize is that it is not really spam. Or you shouldn't see it that way in a vintage computer forum!

Here is why: So what if he posts once a week, twice a month, etc in here? Isn't it nice that there is actually a Atari store/reseller still in business for 20 year old gear? He needs to advertise somehow to us Atari freaks. Right? Yeah for you guys that are in here everyday for the last 2 years it may seem pretty old. And I see your point. But what about that NEW Atari user that just dropped in last week? Maybe he was looking for that almost impossible part and discovers that Bravo might have it. Great I say. Jeeze just because you own every freaking piece of Atari gear doesn't mean the next guy does. Give the guy a break, he is here providing a service and he does not need the kind of flak he has been getting. I am all for any people/stores/etc that offer a service to vintage computers to "spam" these forums. I think that would be the exception though.

Now it would be completely different if someone was to do the same thing for PC gear in a PC group. That would be bad!

Does this make sense? Or am I off base here? ;)

Ok now for the disclaimer: This is just a general statement on this issue NOT a flame on Smeg or others ok? I just wanted to give my 2 cents on this Bravo Sierra and Usenet issue... ;)

Thanks,
Tim

Just a quick, pointless question.

I was watching Terminator 2 t'other day, and I noticed the pocket computer used by John Connor to crack cash dispensers happened to be an Atari. Does anyone know exactly what machine it was, or what it's spec's were?

Another quick question - I was intrigued by a small plastic wallet, just large enough to hold a credit card or other magnetic card, and bearing the Atari logo, that I found lying around the school electronics lab. It looks too small to hold anything larger, like a calculator, so does anyone have a clue what it may have held? Did any Atari machinery use magnetic media like that?

Thanks.

Tom

Actually, there have been loads and loads of Atari-brand calculators in all
shapes and forms. Including, in fact, a credit-card-sized calculator
(solar-powered). One of those may have fitted in there.
I used to have one, but lost it somewhere along the line.

As posted before, it was an Atari Portfolio. Picture at the link below.

looks
> too small to hold anything larger, like a calculator, so does anyone have
a
> clue what it may have held? Did any Atari machinery use magnetic media
like
> that?

The portfolio had a plug in Memory expansion.

(racist homophobic message deleted)

want to stop this crap? next time this loser posts some of his verbal
diarhea, here's where you report it to:

abuse@dizum.com
abuse@zedz.net

-[a]- AUTOREPLY:

Thank you for contacting <abuse@dizum.com>. This is an automated
reply to your message. In this document you will find information
on how to contact a human. Please read through this document, it
will answer most of your questions about the Dizum Usenet Posting
Policy and it will explain how you can BLOCK your email address
from receiving anonymous mail sent by the Dizum anonymous remailer.

-[b]- SERVICES:

Dizum Than operates both a mail2news gateway and an anonymous
remailer. For more information on both please point your browser
to https://ssl.dizum.com.

-[c]- ANONYMOUS REMAILER:

The Dizum system is a remailer which automatically anonymizes and
forwards e-mail. As such it serves an important purpose for many of
its users who could not otherwise express themselves freely, or who
need to discuss sensitive personal topics.

Of course, it is not intended to annoy or harass. In case you have
received an unwanted message, the remailer offers a method to prevent
this from happening again.

To block the remailer from sending mail to your address, please send
a message containing the line

DESTINATION-BLOCK

to <remailer@dizum.com>.

-[d]- REMAILER POLICY:

The remailer administrator will take steps to prevent use of the remailer for any illegal purpose according to Dutch Law.

The remailer is intended for communicating anonymously, not for sending unsolicited commercial mail (UCE or spam). If you ever receive UCE from the remailer, the remailer administrator would appreciate a complete copy of the message in order to prevent it in the future. UCE will typically contain a contact address or telephone number, which is sufficient to identify the sender and -- where applicable -- take legal action against the originator.

-[e]- HOW-TO BLOCK YOUR ADDRESS

If you wish to block other addresses you can do so by including one line of the type "destination-block user@domain" for each address.

As a postmaster, you can block anonymous mail to your entire domain. To do so, please use the line "destination-block @your-domain.com".

If you do not want to read anonymous messages in mailing lists or newsgroups, please consult the manual of your mail reading program. The software will allow you to use `filters' or `kill files' to avoid being bothered by messages you do not want to read.

-[f]- PURPOSE OF ANONYMOUS REMAILERS:

It is easy to store electronic mail for a long time and to search huge amounts of data for information about people when they do not expect it. Thus, the information society may pose a hitherto unknown threat to everybody's privacy. In totalitarian regimes sending critical messages may even cause a threat to the senders' lives if their identity ever becomes known.

For that reason, anonymous remailers have been developed. Remailers use cryptographic methods to conceal the origin of messages. Each message is sent through a network of anonymizing servers so that not even the remailer administrators have any information about the origin of the message. It is impossible for us to determine the original sender of any message. Please don't ask, because we don't know either.

More information is available from the following URLs:

Technical information about untraceability:
http://www.obscura.com/~loki/remailer/remailer-essay.html
http://world.std.com/~franl/crypto/chaum-acm-1981.html

Legal information about online anonymity:
http://www.epic.org/free_speech/mcintyre.html
http://www.law.miami.edu/~froomkin/articles/ocean.htm

-[g]- MAIL2NEWS GATEWAY:

This service allows you to post news articles to usenet through E-mail.
It can be useful if you do not have access to a good news server, or if
you wish to post through an anonymous remailer. Note that this service
does NOT anonymize the news articles it posts. The address from which
an article is mailed will become the return address of the posted news
article.

-[h]- MAIL2NEWS POLICY:

The mail2news gateway is available so people who use anonymous remailers
or do not have posting priveledges at regular news servers or have their
posting priveledges revoked due to controversial opinions or flame wars
can participate in usenet discussions. The mail2news gateway is not
intended as a vehikel to post spam, advertising, binaries, pictures,
warez etc.

Please read our policy concerning Usenet postings, and than decided if
it is useful to re-sent your message to abuse.

-[i]- The Dizum Usenet F.A.Q. v1.03 (03-August-2000)

The Dizum Usenet F.A.Q. v1.03 (03-August-2000)

[01]
Q: Do you censor?

A: No.

[02]
Q: What is your policy on cross-posting?

A: We expect customers to be responsible when they cross-post.
Cross-posting ability is not to be used by customers for the purpose
of "cascading". We may disable the cross-posting ability if we
believe
they are cross-posting irresponsibly.

[03]
Q: What is your policy on unsolicited advertising?

A: We have a strict policy against unsolicited advertising.
We will try to weed out unsolicited advertising by applying
their heuristics into a blockfile.

[04]
Q: Do you consider make money fast (MMF) schemes to be unsolicited
advertising?

A: Absolutely.

[05]
Q: Why do you allow posting to groups that appear to be focused on
illegal activities?

A: It is our belief that a group name in of itself is not illegal and that what is actually in a group does not necessarily correspond to a group name. It is possible for illegal messages to be posted to any group on Usenet and we have no way of monitoring or controlling this. If you believe something illegal is happening, please consider contacting law enforcement so that the posters of such material can be prosecuted appropriately.

[06]
Q: What is your policy on child pornography?

A: We rely on users to follow the law which applies to Dizum and/or the user. We rely on readers to report presumed child pornography to the appropriate law enforcement agency so they may then contact us and follow-up as they feel appropriate. We do not review messages that have
passed through the server because that action in or of itself can be illegal. Further, we are not in a position to know what is child pornography and what is not.

[07]
Q: What is your policy on copyrighted material?

A: We rely on users to follow the copyright law which applies to Dizum and/or the user. If you believe that a user of Dizum has violated
a copyright you should contact the copyright holder directly. We do not review messages that have passed through the server because that action in or of itself can be illegal. Further, we are not in a position to know what is a copyright violation and what is not.

[08]
Q: What is your policy on message floods?

A: If a message flood is resulting in a denial of service, we will stop it. If a user on Dizum is causing it, we may disable their posting ability. A denial of service is when news servers are unable to perform their intended function because of the overload caused by a message flood or other harmful activity. Readers inconvenienced by numerous off-topic or inappropriate postings does not constitute a flood or denial of service.

[09]
Q: What is your policy on non-advertising excessive multi-postings (EMP)?

A: We consider excessive multi-postings to be a flood and we react to it as described above.

[10]
Q: What is your policy on binaries in non-binary groups?

A: We do not have a policy against binaries in non-binary groups and we rely on users to operate in a way that they feel is appropriate for

Usenet and/or the groups they are participating in.

[11]
Q: What is your policy on off-topic postings?

A: We do not have a policy against off-topic postings and we rely on users to operate in a way that they feel is appropriate for Usenet and/or the groups they are participating in.

[12]
Q: What is your policy on a user posting with a bogus return address?

A: We feel users have a right to decide whether to be anonymous or not and so we do not have a problem with a user posting with a bogus return address. The news server software does require that a return address be in Internet standard format, such as foo@bar, but the address does not have to be real. We do require that users verify that the address they choose to use is not actually someone else's valid address or domain. For example, bar@foo.com is actually a valid email address, because foo.com is a registered domain.

[13]
Q: What is your policy on forgery?

A: We have a policy against a user of Dizum making posts in a way that uses the email address of another user on Usenet or the Internet, in an attempt to deceive readers of the true identity of the poster, without that email address owner's permission. In addition, if you are the victim or witness to a forgery, you may want to contact the appropriate law enforcement agency so they may then contact us and follow-up as they feel appropriate. If you feel that your email address
is being forged and you do not want to make use of the Dizum mail2news gateway nor the Dizum remailer we can add that address to the blockfile. This will disable any postings with that from line. Please sent a blocking request for your from to abuse@zedz.net, please refer to question 13 of the Dizum Usenet FAQ so we know for which service we need to block your address.

[14]
Q: What if I don't like one of your customers or what they are saying on Usenet? Will you delete them for me if I complain enough?

A: No. Also, if you feel one of our customers is using the service for illegal purposes, please contact law enforcement and not us.

[15]
Q: I am going to complain to your bandwidth providers because I disagree with your views. What say you?

A: We work hard to make sure that we do not violate the provisions of any contracts we have with bandwidth providers. If a bandwidth provider decides they do not want our business, we will take it

elsewhere as necessary.

[16]
Q: One of your users is harassing me. What should I do?

A: You should probably ask them to stop or try to ignore them. If that does not work, you might want to consider contacting an appropriate law enforcement agency. We are unable to control what users say on Usenet, nor are we able to determine whether harassment is taking place.

[17]
Q: One of your users is libeling me. What should I do?

A: We do not have a way of knowing whether what is said is true or not and so we rely on you to pursue legal action against a poster if you believe a poster's actions are illegal and/or libelous. We do not review
messages that have passed through the server because that action in or of itself can be illegal. Further, we are not in a position to know what is a libeling statement and what is not.

[18]
Q: Why do you allow users so much freedom?

A: We believe that the more responsibilities we take away from a user, the more irresponsible they will act. By attempting to maximize freedom, we believe our users will act responsibly and not abuse that freedom. We run these services since 1994 and this has proven to be the
case.

-[j]- CONTACTING A HUMAN:

The autoreplybot is activated for all messages sent to the abuse@dizum.com email address, if the answers above do not solve your problems of if you need to bring something to the attention of the mail2news and/or the remailer operator please use the address abuse@zedz.net. For your convenience we have already set the correct return address so you can just reply to this message.

abuse@zedz.net is read periodicly and we will try to answer your questions.

Thank you for using Dizum Than !

Perhaps because Atari suffered greatly from piracy years ago. Or
perhaps because we prefer to do things openly and honestly. In any
event, I suspect David Troy will be open to the idea, so why not email
him?

I hardly think we should abandon the group we've read for years (in
some cases decades!). General nonmoderated "rules" apply -- if it
doesn't apply to Ataris, ignore it. I've had a policy for years of
not reading any email past the first profanity or second misspelling.

New users could generally do a search on the newsgroup. In fact, old timers generally do this anyway, before asking a question that has probably been answered a thousand times.
In fact, if you had done a search for BS, then you would see what potential your last remarks had for starting a riot ;-)

Smeg.

The Portfolio is a very functional PC-Compatable computer with an Excel
compatable spreadsheet, calander, word processor, etc.

Not much left, I'm afraid. You'll probably be hunting EBay for a
while.

>
> I understand various video cards can be used. Which ones work? Do you
> have to download special drivers and where?
Various video cards do work, but the adapters to the TT's port are as
rare as memory cards. Again, you'll be hunting for a while.

>

Here's at least a bit of good news. Try hardware.atari.org.

There may well be no difference between the chips. I recall several articles in the past where people noted that EC chips are in fact physically identical to full chips but were labeled "EC" due to the reasons you mention.

Of course, mixups happen at large companies and I wouldn't be surprised if mislabeled chips exist.

I use XBOOT as well, but it isn't freely distributable and really
doesn't offer anything Superboot can't do. XBOOT is prettier though.

There's 2 sides to it, yes Ben makes his living off the Atari and good luck to him but newsgroups are funny places some like adverts some don't, some have more allowance for repeat adverts than others etc etc etc..

What some don't like is the frequency and the fact it's crossposted as well, I myself have had this same argument with Ben in the past despite incorrect assumptions made by our Anon poster.

Whilst I support the idea of Atari dealers making money and serving the community I've always said it should be a short and sweet advert posted maybe once a week and not crossposted.

I don't support anon attacks at group members, I don't support blanket advertising in ANY group as group then tend top become free advert places for every single person and soon the signal to noise becomes way out of control.

I do support our lone atari dealers like Lance, Ben and Best, good luck to them but there's a correct way to promote yourself and sometimes Ben's stuff strays off the path in quantity and content.

Thankfully Ben has started the idea of the mailing list which technically should if done right offer the same if not improved response ratio.
--

Paul...

If replying from a newsgroup remove the OBVIOUS spamtrap, if it's an email then it's removed already.

I agree with you Tim. Granted, I wish his posts were a bit less
frequent (7 so far in June, unless I missed some), but the Bravo
Sierra posts are far less annoying than the responses, which often
number in the hundreds per month.

TM> I was watching Terminator 2 t'other day, and I noticed the pocket computer
TM> used by John Connor to crack cash dispensers happened to be an Atari. Does
TM> anyone know exactly what machine it was, or what it's spec's were?

It's an Atari Portfolio, a "pocket pc" (running some kind of DOS). Google
for pictures...

TM> Another quick question - I was intrigued by a small plastic wallet, just
TM> large enough to hold a credit card or other magnetic card, and bearing the
TM> Atari logo, that I found lying around the school electronics lab. It looks
TM> too small to hold anything larger, like a calculator, so does anyone have a

This could be for memory expansion cards for Atari Portfolios... not sure
here.

So how complete is the emulation? Last Atari 8 emulator I tried on the Atari TT030 was not all that fast.

What type of disk images will it run? Be nice if it can actually run a somewhat decent 8-bit.

Hey, great site with the Atari sightings. I was hoping the appearance of Aliens Vs. Predators from the TV series Weird Science would be there. Oh well. I continue to look for new Atari showings as time goes on.

As for the Portfolio, a fun little device. I made a tribute to one I once knew at..

http://www.geocities.com/lady-aramis/Portfolio.html

I had one, fixed it up, and later sold it. It was fun to play with for a while. Truthfully, being from the Newton world, I was used to longer batteries and flash memory, so static ram and a battery life of only three hours annoyed the hell out of me. :) But when comparing a Portfolio from 1989 to a Newton 2000 from 1997.. well... :)

But a cute device.

True. And I do use Google all the time! Even for my job! Its great when I
come up with a fix before the Net Admin ;)

But how about this argument. With frequent postings one will know that the
said seller/vender is still active and selling items. I don't like emailing
people I saw a post on 6 months prior, asking "Is that still for sale?" LOL

Tim

I tend to agree with this philosophy. Having a moderated forum is less
fun as depending on who the moderator is can just decide he doesn't like
someone and have problems. The moderation system should be a group vote
with a few people running the show.

What does scanning and making available a catalog have to do with
PIRACY?
Are you sure you understand what a Toad Catalog is?

No offense... seriously.... but referring to putting a friggin
Catalog of hardware online piracy?
Um, ok. However, it looks like they (toad computers) had beaten me to
it already, as it's available
in a glorius PDF format! :)

Anyways, thanks Doc Clu for the offer of looking however, Mark has
been so very kind to
send me a Catalog! (Thanks Mark!! Very cool and MUCHO appreciated!)
:sigh: Brings back some good memories... =) I have the 1995-1996
Catalog, anyone has anything older then that, feel free to shoot it my
way or let me know :) thanks~

No problem glad to help! Note if you want to covert a image that is over
830k in size you will have to transfer the file to ST and use a MSA to disk
prog to make a disk That was the only way I could do it.

Nope never did get it to run on my Hades which uses the same TOS
chips as a TT. I would just use the program Atari800.GTP which
uses ATR image files. Works great....

I had the Potato version of Linux running on my Hades060 with a
Nova card. I even had X windows running. Then I upgraded my Hades
motherboard and Linux would not boot up. I was hoping that the
Atari version of Debian Linus would get upgraded to a point where
I could intall it again, but nothing so far.

I really do not know how I got X window to work, but after a
little tinkering, it finally booted up and I was able to use my
Atari mouse.

>
>Wrong. There is a great connection. It wasn't just a random virus I got

You assume there is, but you have not shown anything yet to support that -
the mail you posted clearly shows that there is no connection to Robert.

>after being on usenet, it was in reference to the DOITF030 registration! It
>seemed, to me anyway, that it was more likely that I got the virus because I
>registered for a key (REGARDLESS OF WHO SENT IT), than frequenting usenet on

It *seemed*, but it was not - at least not in the way you assumed. Looking
at the workings of the current virii/worms, it still looks like someone else
- did register for the key and
- has your email address - either from a mail exchange or newsgroup
and the virus picked random data and hit you as a target.

>an otherwise obsolete vintage outdated computer forum. It just seems more
>ligical that If I register for a key on a site, and when I get a reply weeks
>later with a virus, that it was due to the registering on the site. Why

It may seem logical, but you have absolutely no data to support that
assumption!

>got a virus, except one I think, said they registered for a key. Do you
>see the connection now?

No - not unless you have supporting data. You *do* have the IP address from
where the virus was sent (a dialup somewhere in .fi), and nothing more.

Unless you have substantial new information, we can end this discussion now
- repeating what it *looks* like at a first glance and ignoring all evidence
will not bring us any further.

Hi,

How about Atari to VGA to Mac?

You don't say what Atari you have but I got one from a guy 2nd hand who said he got his from www.keychange.co.uk (you don't have to buy online).

For the VGA to Mac you need that convertor from Maplin Electronics, www.maplin.co.uk would have thought you'd have one of those near by.

Hope this helps

Tim

Hello Atarians..

O.K. I tried using my 1040 STF the other day, and the drive was dead.
I had replaced it years ago with a Chinon and it just died yesterday.

My question: Does anybody know of a suitable replacement? If yes, I
would really appreciate it if you would please clue me in as to brand,
model. jumper settings etc..

If this is no longer possible to cost effectively do, doew anyone know if
it's possible to just load Master Tracks pro into my PC via an emulator
program, and then use my PC to read my Discs that I used on my 1040ST?

either way, any help is much appreciated..

best regards,

-doug

I've never made a 9 pin adaptor, only 15 pin.

If you have a 14" goldfish bowl just bin it and get a decent 15" SVGA.

Hi Again,

Just to clarify, the adapter from Keychange was for Atari-vga then from the
vga socket you'd then need the vga-mac adapter.

Hope this helps

You've not given much information, a 2 row connector could be any one of
about 3 or more video connectors.
A plug type or a monitor model number may get you more hits.

Thats fine lets end it now, as we have already determined that the majority
of people that got the virus had registered for a DOITF030 key file. Thats
all I wanted to know anyway, that I was not alone.

...
>I know that there's a "competing" free alternavtive called "fVDI", but
>last time I checked it was still in the development stage, and I haven't

All my software is indefinitely in 'the developement stage'. ;-)

What I mean by that is not that it's not perfectly usable as is, but
rather that I will continue to work on it 'forever'.
Most updates are called 'betas', but that mostly refers to the fact
that they are not made available in proper release archives with
documentation and such.

Unlike MGIF (currently at v5.1, IIRC), fVDI has not yet passed the
v1.0 milestone. Mainly because it still relies on an underlying VDI to
handle the mouse and keyboard (but there's also a few features from
the standard VDI that are missing or incomplete).

>heard much about it since.

Well, everyone with an Eclipse/RageII graphics card is using fVDI.
As is everyone (with any sense at all ;-) who's running ARAnyM.
I don't know what percentage of the Galaxy (TT graphics card by Mario
Becroft) users are using the fVDI driver. I do know that the current
driver for that is not as developed as it should be, but improvements
are supposedly under way.

>So I'm wondering what the current status is, and if it's planned to ever

For me it's been usable since '97.
There's not been much work done on the engine for the past couple of
years, unfortunately, but that's about to change (some rather major
internal changes are under way (but they should not really affect
functionality in any major way)). There would have been more if I'd
heard from people having problems, but that's quite uncommon.

>become an NVDI replacement?

It has certainly always been my intention to implement most of the
VDI functions that NVDI supports. As long as I'm the only one
working on fVDI, that will obviously take a while, though.

> Maybe it'll work better with Notator SL!

Well, since fVDI is GPLed, nothing is stopping you from doing something
about this yourself. ;-)
I don't own Notator SL, so I can not test it with fVDI.

Anyway, the drivers for standard Atari modes (monochrome, 16 colour
and Falcon TC) have not been touched much since I installed my
Eclipse/RageII ('98 or so). They probably have not all been updated
to work with the current engine at all (although the changes needed
should be minimal).
I guess I might do something about that once my CT60 arrives, though,
since I won't be able to install the Eclipse/RageII in the same Falcon
as that accelerator.

about a (bug ?)report about the rage.sys?

-> I suspect the vro_cpyfm from Video-RAM to ST-RAM has (in byte
or word) its bits inverted on the datas. This is obvious when
I try to make a snapshot with this function. This occurs also
on a Vision magnifier, and most of drawing programs.

Best Regards

Rajah Lone

If you mean the TT LAN port then no. The TT LAN port is just another serial
port. Its physical spec is that of an AppleTalk port, but its still
slllllllllllllooooooooooooooowwwwwwwww.

I just replaced the 1.44mb drive in my falcon the other day. It was replaced
by a brand new ALPS. It has the DS0 and DS1 solder patches underneath.

I am in the UK so you may not be able to get one of these models depending
on where you are.

Smeg.

I seem to recall something about that, and I've probably stored it
in my fVDI email folder to be dealt with.
For no very good reason, I've not kept up with my email for the
past few weeks. Sorry about that.

>-> I suspect the vro_cpyfm from Video-RAM to ST-RAM has (in byte
>or word) its bits inverted on the datas. This is obvious when

I assume you mean byte swapped or something like that rather than
inverted (I'll take a look at your email)?

The RageII driver does handle blitting to and from the frame buffer
somewhat strangely. It's all supposed to cancel out, though (but
programs that expect a device specific bitmap to look in some
specific way will get confused (and all bets are off if the
program does direct frame buffer access)).

IIRC, it's supposed to be possible to access the RageII frame buffer
in big endian mode, but there was some kind of problem with this.
I don't recall the details, but the driver does some byte swapping
when blitting to compensate (the device specific format for 16 bit
mode is the same as for Falcon TC, for example, even though the actual
frame buffer is not organized that way).

>I try to make a snapshot with this function. This occurs also
>on a Vision magnifier, and most of drawing programs.

There is a demo of Vision, right? I'll take a look at this.

Do you have some specific example of a drawing program that has
trouble? I've never been into that sort of thing, but I seem to
recall fixing the problems (when possible) I saw with those I tried.
There are, unfortunately, several programs that do things they
shouldn't when it comes to displaying colour images on the screen.

Hello Smeg,

thanks for the reply, I'm not sure what a new ALPS is;-(

I'll try searching for it.

I have tried a few attempts so far with jumpers, etc but nothing has
worked yet.

best regards,

-doug

Rising and falling on the ebb and flow of tide, I watched in amazement as

3863. Rebuilding junker TT030

Newsgroup: comp.sys.atari.st
Date: 2003-06-18 05:43:38 UTC
From: Doctor Clu <drclu@swbell.net>
Message-ID: <BB1566F4.348A%drclu@swbell.net>
Source record: 26345

Well, tonight was kinda exciting. Chris Martin (sysop of the telnetable Atari BBS usually run on a XEGS.. JYBOLAC) and I with another friend tried our hand at restoring a Atari TT030 that was bought off Ebay as spare parts for like $30.

Chris spent off and off working on the TT030 for something like two years and finally he realized after various tests that the TOS roms were bad. Picked those up from Best Electronics for a bit, but they worked.

So now the TT030 comes up with the Atari logo and the memory test. Really nice!

We are now trying to work on getting the floppy drive (and even the SCSI drive) working on the computer and then we'll really be in business. (Chris has a TT030 with Linux running on it, so he's doing good. To matter the fact, we have attended the local Linux meeting with the Atari TT030 just to throw a wrench in it all...) ;)

SO HERE IS WHERE WE COULD USE A HAND.. if you know of a good place to find a drive drive (double or high) and the drive controller chip and drive cable. That would help.

We eventually want to pick up a copy of HD Driver for running Ethernet (a little device through the Appletalk port that adds a Ethernet port) so would love to know where I could get that as well.

Kinda exciting though. But I'm beat... :D

>
> I assume you mean byte swapped or something like that rather than
> inverted (I'll take a look at your email)?

No, I forgot to tell that it's in the 8 bitplanes mode : the bits order for each word in the image data seems inverted, and only for Rage-card-RAM to ST-RAM blitting with vro_cpyfm().
I do not think it's a byteswap problem (or else maybe there's a byteswap in the conversion of bytepacked pixels to normal pixels, I do not know).

It's perfect in TC16 mode.
Thanks for all, you're a genius :), though not DMA access, Eclipse/RageIIc is a "must have" for Falcon, a pity that the CT60 do not have a 030 bus expension on it, fortunatly there will be the SuperVidel.

in TC32 : the Motorola <-> Intel conversion made by the Rage.sys driver is still not corrected (you were working on it, to have the best optimization, but it wasn't important coz TC32 takes to much memory that 14 Mo ST-RAM is a bit short).

> Do you have some specific example of a drawing program that has
> trouble?

in 256c screen only :
- a snap with my fVDI Catcher or JML-Snap when not accessing the screen directly (xbiosfix disabled)
- magnifier in Vision (also when redraws)
- Pixart (when redraws, perhaps, I do not recall well)
- maybe explains the bad palette in Digital Lab
- maybe explains the crash of D2M at initialisation (TRM module, that detects the pixel and screen format)

Best regards

Rajah

3867. WTD: Graphics card for Mega STe

The floppy drive manufacturer is ALPS. Like mitsumi, sony etc. The reason why I mentioned ALPS is because not all drives now have solder patches, let alone finger changeable jumpers.... The one I found with the patches was an ALPS. If you can go to your local store and have a look at a new floppy drive you should not buy it if you cant see either jumpers or solder patches labeled DS0/DS1 etc. It doesnt matter who made it, just whether you can change the drive ID.

The drive being destined for the PC market will have its ID set to DS1 (B:) you need to change it to DS0 (A:), so you will more than likely need a soldering iron these days.

Smeg.

There's so many variations on a theme that it's pretty hard to give a hard and fast recommendation :-(

I used a drive similar to the one that Hallvard used, read his guide from his web site for the download if it's still there:

http://launchpad.atari.org

It will give you an idea of what to look out for in a replacement drive - which is basically the ability to change the drive's ID.

> If this is no longer possible to cost effectively do, doew anyone know if

Try a computer flea market, or whatever is your country's equivalent.

I suppose it depends on what functions of GDOS NVDI is using when you switch that option on - I don't have NVDI's docs to hand, but it's possible that that is a compatibility setting rather than an on/off switch.

You could always email Nick Harlow of 16/32 Systems here in the UK.

There was no sign of Papyrus X at the recent JagFest, not that I asked about
it.

Is it just me, or does there seem to be a bit of a resurgence in Atari user groups? Lately I've noticed several that have either started up or have come back out of the woodwork. I'm even discussing restarting the Atari user group in my town! I don't know, maybe it's just because I spent a while away from the Atari computer scene, but I was wondering if anyone else has noticed this too?

[Hallvard, You are probably still into "X-No-Archive: yes" so your
articles does not show up here]

QED will do this but with some difficulties. It puts in a CR/LF itself on
lines longer than 512(?) characters that must be deleted afterwards and
the document reformatted. Reformatting of the whole document happens when
you select "Format paragraph" with the [shift] key down.

You can even use 1st Word+ for this:

Open the document. Switch to WP mode. Do a search and replace for " "
(space) to convert all hard spaces to soft ones. Reformat document.
Turn off WP mode and save.

So how to get it ?

Just to clarify, the adapter from Keychange was for Atari-vga then from the
vga socket you'd then need the vga-mac adapter.
Hope this helps

I need a svga 15 pins to a MAC 16 pins ...

Computers in general are boring these days. There's emphasis on newer
faster bigger longer, etc. I think people now are starting to look back
to the roots because they want something that not only has personality but
also reflects on their own personality. It's the reason why someone would
pay an absurd amount of money to have a Nissan Skyline imported from Japan
to the US. Not because you can't find anything better for a better price
here in the US, it's the coolness factor ;-) I honestly can't think of
any other reason I still bother with the Atari stuff, and feel like I
always will.

I think Doc here means "disk drive". :) We currently have a WD1772
chip from an old ST in there. I _think_ the TT can handle the 1772 or
an Ajax, but not sure. Are there any dip switch settings for which
disk drive controller is in the TT?

> We eventually want to pick up a copy of HD Driver for running Ethernet
> (a little device through the Appletalk port that adds a Ethernet port) so
> would love to know where I could get that as well.

I second that! Is there any place in the States we can pick up
HDDriver or do we have to order from Atari Workshop
(http://www.atari-workshop.co.uk/)?

Oh, and Doc, you are not using the Appletalk port, it is the DaynaPORT
SCSI ethernet controller....just need HDDriver & the ethernet driver
to get this to work.

Cheers,
Chris

ps - The TT030 is no longer a Junker...

Correct.

>Everest has the unwelcome habit of truncating any line that exceeds 256
>characters, so is not the program of choice in this case.

I agree, that is one of Everest's most annoying habits!

You might like to try Harlekin's text editor, which automatically
wraps lines longer than 249 characters. Then select Text Mode
in Options, and in that menu you can set any desired Line Width,
after which you will then be asked whether you wish to reformat all
paragraphs to that line length. Answer Yes and it's done quickly
and easily.

Regards, /Peter/

Hi Tim!

There is a small AUTO folder program FMC (Force Media Change) that
overcomes that problem. Or return to the desktop and press Esc.

Unfortunately Systems for Tomorrow does not seem to be active. You get a title screen and that is about it.

> Oh, and Doc, you are not using the Appletalk port, it is the DaynaPORT
> SCSI ethernet controller....just need HDDriver & the ethernet driver
> to get this to work.

Oh yeh. Cool use for a scsi port! Guess I still have the ICD link for the Atari version of the scsi port.

> Cheers,
> Chris
>
> ps - The TT030 is no longer a Junker...

Heheh... now it is just a computer that put a pretty screen on the
monitor. Which is a great improvement. Though many would say that
sometimes computers (like the Atari computers) make some INTERESTING screens
when they crash. Take my 400 for example. No really.. take it please. ;)

Take care...

For vintage computing in the Dallas/Fort Worth (Texas) area, and the Atari
hangout chatroom, check out:

Message-ID: <BB165EE0.353C%drclu@swbell.net>
Source record: 26276

Hey Sauron, I know you and I talked about this, but I really think that those that use the Atari computer now are either REALLY big diehards from the days when the Atari computers were top of the line, or people that really enjoy some unique machinery.

I fall into the "I like to call myself an Atari user because few others do" category. Well, I've been an Atari user, and I think I would like to keep an Atari presence on the Dallas/Fort Worth Bulletin boards and such. I think is it fun having the PC and Mac users, but I like to throw in some Amiga and Atari users just for fun. And any other unique platform that can be found.

I like Atari and I like to be different. ;)

I hated it at first, but now I think it is funny how everyone non-Atari thinks that when I'm using an "Atari" they imagine me using a Atari 2600. To everyone else in the world Atari is Pong, Pac-Man, and the Atari 2600. So, these days I say "Yeh I watched a movie file on a Atari last night" and just watch the expression on their faces. :)

Anyway, for those of you in Texas... I mean anywhere in Texas and Oklahoma, drop me or Tim Wilson a line. We are thinking of restarting the Austin based Atari group. I will be Dallas, so I will not be able to always attend phyisical meetings, but I can always join the online chats and the newsletter. Of course I guess anyone in the world can too for that matter...

Laters!

Hello, some of you may know me as the Anonymous Loser! The Nomen Nescio of online idiots! I spend all my worthless time in my moms basement spamming newsgroups and pestering people with my lifeless existance!!! I live in the New England area near the Holland Tunnel and frequently get rejected by girls that I try to ask out!!! Since I never had a girlfriend I am here asking for help! I want your help so bad that I am willing to try 30% harder to be a descent citizen and get off my ass and get life!! I am willing to lay off the twinkies, turn a new leaf, and actually take a shower and comb my greasy hair!!!! With your help I can actually start at the bottom and work at a fast food joint if need be! Can any of you great lads lend a pathetic online loser a helping hand short of putting my miserable existence out of my misery??!

I would appreciate a helping hand from this great community that I have entertained so much of recently!!! I can be reached at nobody@tatooine.homelinux.net or nobody@dizum.com !! Or reply here! Since I have no life I will reply back right away!!!!!

Thanks in advanced for your business!!!

30% better effort to not show my face in here and annoy you again!!

The ST used a WD 1772-02-02. An upgrade to 1.44 Mb diskettes required
something called an "Ajax" chip and TOS 2.06. What TOS does your TT
have? 3.01 and 3.05 won't allow HD diskettes, but 3.06 will. For
that matter, are you sure you don't have a floppy chip? It's a
soldered part.
>

HD Driver is for drives, not Ethernet. The Ethernet possibilities for
Atari use either the cartridge or the SCSI port.

For the south-east of the UK, the Cheshunt Computer Club is probably the
longest running UK Atari supporting computer club.

We started off as the Lea Valley Atari Users Group (LVAUG) many years ago,
and there was a thriving newsletter exchange scheme with other clubs (mostly
in the States).

> chum
> Benny cuz now, we ain't stopping AT ALL!!!

You never intended to stop, loser boy. In fact, you enjoy your sick
little power trip and are just using this as a substitute for the lack
of human interaction and a life you suffer from. Ben's postings were
just an excuse for your deviant behaviour.

>
> Bunch of Bravo Sierra F*****!

> -A.L.F [Atari Liberation Front] A.L.F-

the only thing Atarians need to be liberated from is from losers and
cowards like you. I kindly suggest you crawl back up your own alimentary
canal from whence you came :)

Now, if you want to be a REAL hero to this group, go to .advocacy and
harass Sinclap, there's a troll who's the same IQ to play with.....

Remember, folks.make sure you report all attacks by the loser troll
(please note, folks - singular - this guy is such a noxious little twerp
nobody will side with him) at ALF to abuse@zedz.net .
--

I don't have a scorched earth policy - only scorched trolls....

Hi

I have a couple of Monitors for the Atari ST series. One is a hi-res monochrome which needs a bit of attention. The other is a colour monitor which, last time I used it, was perfect.

I just want to get rid of them. If nobody answers they'll simply get thrown on the local dump. However, if you want the colour, you must take the monochrome as well.

I am in the UK (Croydon, to be precise). If you're interested, email me: webcrawler AT Icrazy DOT com.

The Captain

In this case the TT030 didn't come with the Ajax chip. To matter the fact, the socket where that chip would have been placed was gone. And luckily we now have TOS 3.06. After hearing what I have from you here, I am glad I picked that TOS and not another.

Ok, as Chris corrected me, this is a SCSI solution. And I'm looking forward to it personally.

Greg's TT has TOS 3.06. And the Floppy controller chip on his TT030
board
is not soldered down, in fact it had just a vacant DIP socket where it
should
have been. I don't know if whoever had it before him did this, or if
it came that way (his mother board version and layout is different
from mine). We
pulled a WD1772 from an STe that had a socketed part as well. I think
that
that works fine, we were just having problems with the drives.
Sometimes
you could access a disk and sometimes not, but I found that those
drives
were bad since I tried them on my TT, and they did not work.

> Atari use either the cartridge or the SCSI port.

It is true that HDDriver is for drives, but a SCSI driver that detects
the DaynaPORT SCSI/LINK (SCSI-to-ethernet) controller is needed before
the DaynaPORT
driver is loaded. Although there are other choices for a SCSI driver
that
may work, HDDriver seems very stable....so we need both a SCSI driver
and
an Ethernet controller driver.

I have the demo version of HDDriver currently, and it detects the
DaynaPORT
fine and the driver for the DaynaPORT loads, but it bombs if you try
to actually
connect to the network...I am positive that this is because you cannot

write to
any other drive other than the first one with the demo version....

I love it when old hardware starts to work again.

No this TTC1434 is a 14" monitor with a 15 subD connector??

I think it's a:

TT = I think TT series
C = Color series
1434 = 14"

But like to have the specs.

The 19" Black/White monitor is the TTM195 monitor...

3923. CT60 : and the winners are ...

Newsgroup: comp.sys.atari.st
Date: 2003-06-20 10:14:34 UTC
From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3ef2de8a$0$4601$626a54ce@news.free.fr>
Source record: 26205

25 boards are expediting this day !

Who are the lucky guys ??
hum, I let them to tell you ...

The copy of the mail I sent to them :

The package is :
- CT60
- FAN to be connected on the CT60 (connector near the corner of the 060).
- IF YOU SOLDER : Ribbon cable, 1x 68 ohms resistor, 3x 33 ohms resistors SMT

For the moment, remember you need :
- SDRAM DIMM PC133 (or 100) 64 to 512 MB (SEE the WEB SITE for compatibility !).
- ATX POWER SUPPLY + PUSH BUTTON (not furnished because of the tower recommended configuration).
OR ATX TOWER (no need a big, a medium is cool).
- A ON/OFF switch + 2 wires + HE13/14 Femal 2 pins connector to connect on the CT60 connector to allow you to go back to 030 mode...
This is not fiurnished (sorry !) but will you yet use the 030 mode ???
You can put a jumper if you really need to go back if you don't know how to solder 2 wires....
If you solder 2 wires, please don't solder on the pins of the connector (let them clean for me if I need it !), but undfer the board on the solders of this connector.

In few days, the fitting documentation will be online...

ATTENTION :

1- For those of you that get a CT60 without 060, it is your responsability to plug your 060 and stick the heatsink on the 060 !
Don't be stupid with this operation ! a bad insertion of the 060 in th socket will destroy it !
Not using the heatsink (and the fan is to be used too if the machine is closed !) may destroy the 060 !
USE a THERMAL STICK ! It's maybe expensive but a classical stick will not dissipate the 060 !
SEE the WEB SITE pictures (will be ready tomorrow !) to see how to get the 060 on the board and how to stick the heatsink in the better position for falcon original cases !
For original cases, the fan can not be plugged on the heatsink if you keep the keyboard in the initial position...
There are several ways possibles to get the fan near the 060....Imagine...

2 -Some of you (those who get a 60 MHz 060 model, have a 72 MHz oscillator in the package !
This is for pure fun because I don't support the 72 MHz configuration !
Some tests show that the few 060 /60 I tried have timing problems with caches.
The actual loaded SDR chips don't support 72 MHz.
To try the 72 MHz, you need to :
- make a download cable (see the downloadable CT60.LZH package).
- download the SD4D version of SDR (the actual is SD4F) : those files will be on my web site....
- be lucky with your 060/60 ! Let me know ...
What are the difference between SDR 4D et 4F ?
SD4D is the previous version of the SDRAM controler and use only one PAGE comparator.
It was tested and approoved at 72 MHz !
SD4F is a optimized version with 2 PAGE comparators : it's a bit faster and may be really faster with some software.
See the CHG documentation (the next one, not yet online !).
SD4F run up to 69 MHz, not more.

I see nothing else to tell you now (all will be present in the fitting file)....except ...

HAVE FUN !

Regards

Hmm, as today is im-/export of chickens allowed to the Netherlands? There
are probably still some restrictions due the recent outbreak of fowl pest.

Also if I'm not wrong there are some problems in the USA (or is it Canada?)
with the mad cow disease. Now I think about it, that's maybe the problem
with him. So he probably won't get the permission to jump on the plane.

A MegaFile 20 needs no manual. Just plug it and it should work... if it is in working condition AND if it is formatted.

Plug the power cable in the wall, plug the other cable (you got two cables, don't you?) in the back or your ATARI, push the ON button on the MegaFile 20 and wait about 10 to 15 seconds. Then push the ON button on the ATARI, wait a few seconds for it to boot and you should see the hard drive file cabinet on the screen.

If something goes wrong, you must tell us when in the above sequence it does.

If everething is right, the second thing to do is to run UVK 2000 (an anti-virus program) on all files of the drive.

Good Luck!!

I dumped Stewart due it it exploding my system with GEMDOS errors, i believe
it jumps into various GEMDOS hooks to intercept the menu bar mechanics.

Yes, there were quite a lot of errors in that code... :-)

I have now managed to get a working GFA Basic app that reads the parallel
port with an assembler inline hooked to the centronics interrupt. It does
seem to work fairly well when sending from a MSTe and receiving with a
TT. With the TT running standard TOS 3.06 I managed to transfer a 13 KB
file without errors.

With the TT under Magic and the rest of my standard setup with STinG and
everything I got two errors at one point in the file.

However... The reason for writing this program was to be able to transfer
files from my old Casio PB-770 pocket computer but that does not work so
well...

All data arrives on the Atari but every byte with the upper 4 bits
stripped to zero! Strange... Maybe there is a timing problem but I've
seen this behaviour all the time even when trying to poll the printer
port. I'm beginning to wonder if the Atari draws too much power on the
datalines or something. All three computers still print perfectly when
attached to a real printer, though.

Anyone with an idea of what could be wrong?

I have put up my GFA app with all sources included at:

http://atari.mine.nu/read_prt.zip (13.1 KB)

Wish I could say it was that complicated.

First off, that auction is simply a 520 ST shell with a non-working keyboard. (Though all the keys have all the rubber bits, so maybe good for parts).

THE TRULY INTERESTING PART...
Once apon a time, I took a 1040 STe, upgraded to 4 meg (that I'll be selling soon.. just want to get the floppy drive working better first... all else works).

I took the then 4160 STe :) and took it apart, re-cased it, a CD-Rom drive, hard drive, Spectre GCR, and a AT Power Supply and stuck it all in a PC case that had a similar case style as an Atari 800. The idea was that was doing the 800XLDJ thing (virtual drive system) for the Atari 800. The case and the AT power supply (modified to power an Atari ST/STe plus multiple other devices AND a monitor all at once) will be for sale soon as well. Or if you read this and are interested, just write me at drclu@swbell.net.

The wire between the keyboard and the motherboard was extended from 6 inches to about 6 feet using some flat lan cable... so at that point I had an external keyboard. Once that was out, the 520 ST case housed the

keyboard (being the smallest ST case in existance.)

Incidentally, the person who buys the 4160 STe will have that six foot chord to have an external keyboard whenever they choose. (and a SM124 monitor, and maybe a color monitor and monitor switch depending on the deal) :)

So I can say I've gone through what so many Atari users go through... to have the Atari STe go from the all in one boogle board, to a PC case and desktop computer. But in this case, there was a chance to go back, since it is all back together again. :)

(People like vintage STe's over re-cased ones.. I can see why I suppose..)

Hi

What was that game, quite polished, two player, puzzle (arrange the yellow shapes).

The gameworld was quite purple, the screen divided in two down the middle. You ran back and forth along the bottom of the screen grabbing falling shapes and putting them in your big matrix, trying to copy a shape from memory before your opponent.

While the game was loading there was a little band (bongos, guitar and funky bass) that played to you.

When you finished a level there was a sample in a croaky "cool" voice that said "hey guy, you got it" (said the great priest).

It then stacked up a load of coins depending upon how well you played.

It was french but I think I got it on a coverdisk from STF or ZERO.

===What was it's name?===

Toby

Hi Steve,

Thanks for your answer. (How was the Atarishow?)
I've heard that before about Stewart and will
consider to turn it off.

Enjoy your weekend,

Raoul Teulings

Does somebody know why only a few changes will be performed in MagiC after i've changed them with the configuration program. In my case only the logo is replaced and the title bars appear. All the other changes are not visible. I use a Nova card.

Raoul Teulings

Even though it was on my doorstep i didnt attend. 8~(My car tyres are
getting a bit desperate and i've no money to replace them.

> I've heard that before about Stewart and will consider to turn it off.

I've not heard from anyone without problems with Stewart, Have you tried
Xgem, that will give you some customisations.

My ADSL ISP has "severe problems all over the country" so my server above
is down... Yesterday was Midsummer Eve here so I guess the technicians
are all sleeping after too much to drink... It may take some time to get
it fixed.

I have put a copy at http://www5.tripnet.se/~kennethm/read_prt.zip

Btw. STinG is really nice. To switch from Ethernet to modem you just have
to load another DIAL.SCR and dial in to another ISP without making _any_
config changes. After next reboot my TT will be back with Ethernet DNS
servers etc.

If you are talking about the latest version of Papyrus, I get an error also at times when trying to load it on my Hades. For me I can get it to load if I turn off my caches or do not split my Ram. If I have my caches turned off, I turn them back on when after Papyrus loads. Of course, all of this happens under Magic. Uncer Mint or Geneva, things are fine.

Yes I would imagine it would take awhile on a TT. It took an hour
or so on the Hades. The trick is to install only the essential
files. The others (games, applications, etc) you can install later.

Not sure really, but I would use PARCP which does file transfer
through the Parallel printer ports quite nicely.

Well, there is no PARCP client that runs on a Casio PB-770... :-)

But, If there were a "One way printer emulation" mode in PARCP... I have
only read the online documentation for PARCP and can't find anything
about such a mode.

I thought the same about some old Commodore hardware manuals that I put
up... until Amiga Inc. contacted me and told me that they were the copyright
owners and whilst they were happy to give permission I should ask permission
in future. I also had to change a couple of things on my website, like add
trademark acknowledgements etc.

Regards,

Clockmeister.

3960. Troubleshooting a dead 1040STf

Newsgroup: comp.sys.atari.st
Date: 2003-06-22 04:54:27 UTC
From: Tim <tjlazer@nospammail.com>
Message-ID: <vfadk5bhas6067@corp.supernews.com>
Source record: 26242
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I have a 1040STf that is dead. I get two bombs on screen with a beep when turned on. I found that TOS chips not seated can cause this so I took the system apart and reseated the chips to no avail. I also tried this: I removed the 6 TOS chips and powered up the ST and I got a blank white screen. Can this be a indication that the TOS chips were causing the two bombs? If it was something else wouldn't I still get bombs on screen?

Tim

I would say that a hardware manual and a catalog/advertisement are two different things entirely. I see no problem with posting a catalog which was given away for free that's outdated by a decade.

The tos chips are probably running if you get 2 bombs, are you sure you got the HI and LO the right way around ? are you trying to boot with a floppy ? faulty boot sectors can crash the ST.

Why not go for a more update TOS like 1.4 ? I have a pile of TOS 1.0 and
1.2 chips which I dont use anymore.

3967. Falcon-related stuff wanted.. & Help?

Newsgroup: comp.sys.atari.st
Date: 2003-06-22 08:38:39 UTC
From: JagCube@yahoo.com
Message-ID: <83fbea98.0306220038.178c22ee@posting.google.com>
Source record: 26099

Hi everyone...

I'm needing some help getting some stuff, just in case any of you may have or know someone
that has this stuff it would be of great help!

1)What cable can I use/need to run my Falcon throgh a router for example so I can pump the net
into my Falcon?

2)Using the net and so forth, where can I obtain an ENGLISH copy of Magic at? and what versions?
(as if I remember correctly, you need all that goodness to actually use CAB, yes?)

3)Anyone have any MIDI cables/and software for trade or sale?

4)Does anyone know if the Falcon can read DS disks? I just won some games (ST) and the falcon
doesn't read them , at all. Possibly bad maybe?

5)Does anyone have a spare or non-wanted (I think it's a 286PC emu board) they are willing to part with for the Falcon?

6)Is there a program out there that can let you (UN DELETE) and Detect undeleted files on the Falcon hard drive? (Something like the dossy machines had... undelete *.* which would
show you files that were previously deleted? Or maybe some other means of recovering data
that would have been previously deleted?

7)Does anyone have for sale a Beetle Mouse? (or know where I can possibly obtain one)
I remember seeing them and they looked fairly nice.. anyone use one? comments?

8)What's the biggest size HD (internally) I can put in the Falcon? Say I get a 1gb HD, do I have to partition all that good stuff? Software?

I think that's it for now... at least, all I can think of now!

Any and all help is much appreciated... many things I'd like to do with the Falcon and things to get
for the Falcon so :)

Thanks guys!

Clint Thompson

Yes, use Diamond Edge: http://www.anodynesoftware.com/edge/main.htm

> 8)What's the biggest size HD (internally) I can put in the Falcon? Say
> I get a 1gb HD, do I have to partition all that good stuff? Software?

With HDDriver you can use HD drives of one terabyte and can have 1 Gb
partitions on your Falcon.

Definitely - the TOS chips *are* causing the bombs, since they contain the
code that draws them on the screen ;-)

However, that does not indicate they are at faulty, probably more the
opposite.

Try extracting/re-seating all socketed chips (and other connections - RAM
add-in boards etc.), especially the square PLCC ones. Cleaning the contacts
of the PLCC chips and their sockets with a glass-fiber eraser might also
help.

Before taking all of the chips out you can try the classic atari drop.
It sounds weird but I have used it a number of times on cranky
machines and it works. Lift the computer about 3 inches off of a hard
surface and drop it onto the surface. This tend to reseat the chips.
If you open the case and push down on all of the non-socketed chips
you can get the same effect. I have a towered MegaST and because the
case stands the motherboard on its side the chips come loose
frequently. I just open the case (while the power is off) and push
the chips back into their slots. It works.

Hi,

I have one set of ROMs. TOS 1.6 28 pin which I would like to sell.
They were from a 1040STE. I do not know if they will work in your machine.
I upgraded to 2.06

let me know if you are interested.

ken

TOS 1.6x only work in 1040STE machines and only there, neither in plain
520STs nor in Mega STEs. It is 1040STE only.

Only for a short time. After that, you will have to re-do the procedure, and
soon you will have to take out the chips and clean the pins anyway.

By 1040STE you mean 520STE too......

Ok lets get the ball rolling.

You mentioned TOC. Table of Contents. That terminology belongs to Minidiscs, CDR's etc. Correct floppy disk terminology you would have said "Directory structure" or similar. That is all I was saying. No biggie.

And as far as I am aware there is no issue with disks getting wiped. At least I have never seen it, on any TOS machine.

Smeg.

Well I want TOS 1.0 for game compatibility on my 520ST. I already have a
1040STe with 1.62 and also a Falcon030 with 4.02.

Do you have the 6 chip TOS 1.0 you want to get rid of?

Tim

Yes the chips are in correctly, all in order. I disconnected the floppy as
I have the machine in pieces, trying to isolate the problem. I am wondering
if one of the TOS chips is causing the 2 bombs... With 6 chips it is hard
to tell. What else can cause a Bus Error?

3987. Help with HD Driver

Newsgroup: comp.sys.atari.st
Date: 2003-06-22 17:53:37 UTC
From: Doctor Clu <drclu@swbell.net>
Message-ID: <BB1B5811.4C91%drclu@swbell.net>
Source record: 26119

Years ago, I picked up a older copy (even then) of HD Driver from U.S. based Systems For Tomorrow. I used it a few times, and then the disk stopped working. And in truth, so did another Systems Solutions disk, being Cab 2.7.

I was wondering if anyone had a copy of these two that they could send me. (zipped disk image). I still have the manuals, it is just that the disk in both cased went belly up. And at least HD Driver would be nice to work with again as I am trying to rebuild a TT030 at the moment and trying out Ethernet and such.

Any help will be appreciated.

Thanks!

Maybe were the heads very dirty - as to become abrasive - and
destroyed one ore many tracks on the disk ?
It used to happen many times wit PCs at work, so now, everytime
I have to use a floppy, I first clean the heads!

J.-Luc

Seems our little creep from New York/Jersey has moved to this remailer....
having recvd a little email from him.

admin@italy-anonymous-remailer.it

Well, this is quite interesting because Italy is a EEC member and the data
protection/abuse laws are slightly different here... ie Web Services are
responsible for the usage of their services (as per recent Demon case)....
I am obviously contacting them direct and will if I have to give them a
little legal nudge... keep you informed

Very unlikely, especially if they are ROMs (as shipped by Atari) and not
EPROMs.

>What else can cause a Bus Error?

Nearly anything on the board - a bad contact anywhere, faulty Glue, DMA,
MMU, CPU (unlikely), or a bad TTL or memory chip.

Most likely is a contact problem.

If the machine comes up far enough to display bombs, a test with the atari
diagnostic cartridge might help to diagnose the culprit.

If you find nothing in that area, you have to start swapping chips - MMU,
Glue, DMA are socketed and easy to check. Do *not* mix IMP and non-IMP chips
- they may or may not work, so this is not good for checking a faulty
machine.

Received help on this. It was an older copy so hopefully that will be enough to get me started. Probably get reminded why I stopped using this version of HD Driver and continued using the ICD utilities. But then I'm sure 8.11 will probably have some add ons that I will want to get that one for. Appreciate the quick response and helpfulness people offer on this newsgroup.

Take care and thanks!

Some 1040ST motherboards had 2 banks of ramchips soldered into the motherboard under the PSU, 1 Bank on the left for 520ST and both banks filled for 1040ST. If you are lucky and have got a 1040 that has got the second bank in sockets, and your even extremely more lucky in the fact that your 520 is the same type of motherboard then you could take the 2nd bank of memory out of the 1040 and put it in the 520. Dont forget that there are a few resistors as well that will need to be added. You will need good soldering skills in order not to fry the memory chips when putting them back in (though really you should buy some more sockets and solder them instead).

I wouldnt bother though, as its easy enough to make a 1mb upgrade for your 520, and after all this it could be that the RAM in the 1040 is bad, and maybe that is why its not working.... ;-)

You are chasing your own tail here I suspect. Using multiple remailers means that the Italian remailer can only give you the name of the remailer they got the post from.

Nobody is going to bother with tracing back an anonymous email all the way back to the source because it is probably sent from a public computer (internet cafe, library or university or similar) if the poster is clever. Even if he isn't, there is a multitude of software and online mailers that will fake the originating ISP as well.

It's a waste of time, using a filter and not replying to his messages is an easier and smarter way of preventing this rubbish IMO.

I believe Falcon TOS can handle just under 1 gig without issue (like 999
megs has been successful for me). You can have as large of a hard drive
as you want, just you have to partition it out. I am not positive but I
think if you use MiNT you can have BIG partitions for the ext2 partitions.

Give me your serial number of HDDRIVER and I can send you a copy. Note
that HDDRIVER is commercial software and it is not legal if someone else
sends you a copy. Also note that you are not entitled to newer copies
than the one you actually had, as otherwise an update would be required.
Please refer to http://www.seimet.de/hddriver_english.html for more
information.

8.11 is commercial. Using illegal copies will not be helpful for Atari
users if they want support for HDDRIVER to be continued.

Yeah, I implied that, sorry. Ofcourse a 520STE is like the 1040STE except
for amount of RAM.

cheers,
Matthias

Okay, I don't beleive no-one played this game, so I've gone one step
further...

Please visit this site and see some (very artistic) pictures I've
drawn of the game to jog your memories!

http://www.asktoby.com/atari/atari.html

I *know* you tried this game demo out on a coverdisk. STF, I think?
Go! Look! Remember! Tell me what it was called! Tell me what disk it
was on!

Thanks

Toby

4004. Wish to buy a TT, but have some questions, can someone kindly answer please.

Newsgroup: comp.sys.atari.st
Date: 2003-06-23 11:41:18 UTC
From: Rob <rob19@eggconnect.net>
Message-ID: <2gpdfvg3b4jsjbatnv7fcn6cs41k8e0tkv@4ax.com>
Source record: 26135

It's getting closer to the day when I'll be buying a TT, I need a few questions answering though.
(Primarily to be used for cubase, but if I can figure out the complicated installation system of all these other desktops and O.S's I may be tempted to put one of them on.)

Memory wise:
* How easy is it to upgrade, I've heard that they can take standard simms - don't know how true this is. How much can I put in without any further add on cards (only cause they're hard to find)
* If I get a 2 meg machine, should I get more ST Ram for it, or upgrade it with TT Ram (I suppose it goes back to the previous question of "how easy" if it was fairly standard, I'd stick in as much as is cheaply possible.... i.e. without any expense on memory card thingies.)

Graphics wise, I've been reading a lot of spec sheets on the graphics resolutions of the machine, but it doesn't tell you which of these uses a graphics card. Whats the best res I could get without a graphics card (again, for cubase, a good res would be nice, though I suppose I could get away with using videlity to up the res a bit), and does it use up all the screen, or put a big black border round like the old atari moniters did.
Also, I found on this link http://home.wtal.de/dk/me/atari/tt.html, a bit of info, if you goto the bottom of the interface section, at the 6u vme expansion bus, something about being able to add a 2mb ATI mach 64 graphics card, which to me sounds like a PC type graphics card , is that right, could you put (I'm assuming) an ISA graphics card in, and use some drivers (from somewhere ??) and it would work, do you know what type of card this VME slot can take ? (meaning, if it can take a mach 64, would I put an ISA card in, or would it actually be PCI ????)

Finally (I think), Some spec sheets say 1.44mb floppy, some say 720k floppy, is that just an age thing, the newer versions had 1.44mb floppies, and is a 3.5 inch size hard drive ok to fit inside, or does it take the smaller 2.5 inch type.

Thanks for any info... Rob

Mark,

Share the Mouse Wealth! ;)
I've always wanted a beetle mouse.... wonder where I can get one for a
good price
(sides you ;) heh...

They have ones that light up too right?

Cool, I'll consider getting just a 1gig internal then, or maybe even
around 800mb, as I dont
think I'll really need all that madness space. (at least, I dont think
;)

Still not sure how to go about the LAN thing...

Clint

Source record: 26138

That is a lot of questions. The TT was designed as a workstation server, with many serial ports, at a time when VME was the professional standard for everything. Still is, in areas. VXI is VME extended for Instrumentation.

Now, every upgrade costs, and is hard to find. I do not know about Notator. I got one of my TTs with E-Magic-something, possibly Notator, so I know that runs.

TTs take VGA or ECL monitors. The highest ECL resolution is the same as ST High, but on a larger monitor, which costs.

And there will still be a black border. That is necessary for linearity. The edges are not linear, and if you are using a TT for any non-play use, you need linearity.

Graphics cards, for more than 1990 TT-Medium color resolution, are not current production, but can be found, and cost.

I paid $500 for a memory card, and $1200 for memory, for the TT I use. You get a basic TT with, I think, 2 megs of ST memory, and the rest is memory cards, or hacking. It is the memory cards that take simms.

In other words, adding to the basic machine is not cheap, but I think it is useful.

Jim

Source record: 26139

My opinions follow.

1) You need to get an ethernet adapter to do that. Those either cost a bundle, or a lot less, if you can find one. You have no asked where to find one.

2) you have an answer to that--Systems Solutions Atari Workshop.

3) no. Some is freeware, some costs, all is good.

4) yes, should. Maybe bad drive. I have not used my Dysan drive test disk since I learned that most drive problems could be solved with a little libration, way down in the details.

5) nope, but why would one want to emulate a DOS clone?

6) yes, many. DISCUS is a good one, if you can understand German. Disk Doctor I have, and might send. The latest of Diamond Back, from Anodine, will do. There are others, too.

7) No, no Beetle Mouse. Try E-Bay

8) Infinite, is your drive size. What determins what you can use of an infinete drive size, is your operating system and you hard disk driver. I would suggest you get the latest HDDriver, from Systems Solutions Atari Workshop, which will let you get all that your Falcon operating system will allow. I have a TT, and suspect that 512 meg per partition, which should be enough, will be what your Falcon will handle.

8.5) CAB will run on Plain TOS, but that comes from Systems Solutions too.

Jim

Cubase doesn't work under MagiC and Mint, you'll have to use single TOS and
a bootprogram to use the other OS's.

I mainly just want the case, plus the keyboard (all keys intact). Don't need the floppy drive or motherboard. They'll just add unecessary weight.

Offers by US residents only.

Let me know what you want for it + the shipping cost to 85635 (Arizona).

Can pay by PayPal only. Request UPS Ground shipping, to track.

Luposian

I swapped most chips from the 520STfm to the 1040STf and still the same
problem. Two bombs. So atleast the TOS is good in the 1040! I may use the
TOS in my 520ST, though I think having the Boot ROMs is kind of cool, but
makes the machine useless with only 512k!!! ;)

As a side note, what do you think I should do regarding a 520ST as far as
collecting purposes. I have a original 520ST that needs TOS on disk, should
I keep it as such or upgrade to TOS 1.0 ROMs? (I have a set I can use) I
don't really plan on using it as I have other STs, but I am simply
collecting it. I kinda like the fact it has the boot ROMs and you get that
cool bootup screen...

4020. TOS .99 Boot Disk?

Newsgroup: comp.sys.atari.st
Date: 2003-06-23 16:02:37 UTC
From: Tim <tjlazer@nosmapmail.com>
Message-ID: <vfe94t37cm7290@corp.supernews.com>

I heard there was a TOS .9 something or other boot disk for the early 520STs that did not have TOS in ROM. Is this the verision of TOS shipped from Atari? Or was it 1.0? Does anyone have a image of TOS .99 or the official one released by Atari Corp? I have a 520ST and need a TOS Boot Disk as I lost mine.

Thanks
Tim

I would exchange the bootroms for a real TOS but keep the bootroms for
historical reasons.
BTW. i'd be interested in a dump (read image) of these old bootroms for
exactly that historical interest.

If you manage to do, I suggest even fitting TOS 1.4 instead of 1.0 as that
has lots of bugfixes compared to 1.0 and the 0.99 TOS supplied on disk.

cheers,
Matthias

I use the bootprogram STOOP. I have four different setups: TOS 2 C(olors) for CAF, TOS 16C, TOS 256C and Magic 256C. No problems, you can choose for each setup which autofolder, acc's, cpx and gemsys programs you want to use. Some MIDI programs will run under MaGic (The ECow progs, ACE, Sweet 16) but remember to turn all midi gear off when booting MagiC, it's a bug. After Magic is started you can turn them on again.

Regards,

Jos

PS Some say they can use Cubase under Magic using a monochrome monitor, some say it will work partly under MultiTOS or Mint. But Cubase isn't stable then.

Is there a floppy in the drive?.

Describe /exactly/ the sequence of what happens from the point you switch
on.

Try leaving it powered up for an hour and then power cycle, it may be a
power supply problem, leaving it to warm up may aleviate that.

Keep it origninal, standard 520's are ten a penny but not many with TOS on
disk..

WHat was the boot screen like, wouldn't mind seing a grab of this? (sad, I
know!)

I have an old Amiga 1000 with kickstart on disk, but I never got to see an
ST early on...)

I do know when Tos 0.99 bombs out, you get mushroom clouds instead of little
bombs..

No. The *early* 520ST Computers also sold w/o TOS in ROM. It was the
520STm and 520STfm that sold with TOS in ROM. I know because I bought a
520STm in 1986. ;)

I recently obtained a early 520ST that needs a TOS Boot Disk to work! I
created a TOS 1.0 and 1.04 Boot Disk and after TOS loads I have like 200KB
left so the machine is useless!!!

If you're gonna stick an ATX mother board in it and call it an ST then I've
beat you to it, I've got a 2.6Ghz Pentium 4 powered, ST-cased with 1Gig RAM.

Looks odd, a 1040 STe running windows server 2003 with Office XP 2003 beta.

4030. NVDI : boot order and setup on Hades 60

Newsgroup: comp.sys.atari.st
Date: 2003-06-23 19:14:20 UTC
From: Olivier VANONI <ovanoni@icor.fr>
Message-ID: <WS3.7c78d9dc.63945e81.ovanoni@icor.fr>
Source record: 26158

Hi everybody.
I installed NVDI 5 on my Hades 60. Magic 6.10 and Jinnee were already
installed.
However, I often have bus errors when accessing disks or during program
usage. These errors disappear as soon as I de-activate NVDI (and reboot
the Hades).
Can someone give me some help about the NVDI programs boot order in
Auto folder and the configuration that may be needed by Magic/Jinnee
to work perfectly ?
Thanks in advance.
Regards.

4031. TT030, Laser Printer, Integrated color monitor, software, for sale

Newsgroup: comp.sys.atari.st
Date: 2003-06-23 19:38:07 UTC
From: alex@never2funky.com
Message-ID: <5bd9cb8.0306231138.1ebb1429@posting.google.com>
Source record: 26162

I have the following available for quick sale:

Atari TT030 - Guarenteed against DOA. Memory upgraded, hard drive, everything!
Atari Laser printer - Excellent condition! Very nice print.
Atari Laser toner cart - New one is printer, new one in box
Modem - Older, but works with the atari
Plotter - Works with dynacadd. Will sell for shipping if the entire system is bought
Monitor - The color version that matches and hooks to the tt030 case. Nice picture. No dull spots. very clear Guarenteed against DOA.
Software - Pagestream, Word perfect, Dynacadd. All books and dongles
Syquest Drive - Removable HD cart thingermabob
Dot matrix - I don't think anyone wants it, but it came with the system, so if you want it, it will just cost shipping if sold with the system or I'll just toss it inthe trash. comes with extra ink.

I originally broke my neck looking for this and other cool machines from the better days of computing, but I really don't have the time to beef this sucker to the levels I wanted. Mostly because it takes so much time to just find the parts I want like video cards and ethernet.

Everything is in excellent condition, but the case needs to be cleaned a bit. The previous owner must have been a dirty fellow. Easy to wipe clean and I might just do it prior to shipping.

If you would like further specs, digitial pictures, etc. Don't hesitate to email me at alex@never2funky.com. I accept payment via paypal.

Buyer pays shipping and I will break apart system, but prices won't be as attractive.

I am flexible, but don't be silly, I paid a nice piece of cash for this excellent machine and don't plan to just give it away. Send me your real offers and if it sounds reasonable enough, it's yours. Move fast and I'll be even more flexible.

If it's not gone by this friday, I'll just place it on eBay, but wanted to give the true fans a first crack at it.

Later!
-Alex

Do you guys want me to drive down to Toad Computers and get permission to
settle this odd debate? They DUMPED their Atari stock. They WON'T care.
Trust me. Just ask and they'll probably tell you they don't care.

NO! My Mice! ;-) I use my beetle mice all the time and I modified one in a cool way. I dremeled out a nice fuji that a blue LED shines through. I like to do crazy modifications like that ;-). I don't have one of the official light up beetle mice and never heard of such a thing. I have 4 4.x gig SCSI IBM hard drives mainly for backup purposes and a RAID/1 (manual drive to drive copy) as well as a 3.9 gig (I believe Quantum IDE system drive). Though quantum drives are notoriously unreliable this one seems bulletproof so my strategy of buying a whole lot of scsi drives to serve as backups may or may not have been pointless ;-).

I can't give up my beetle mice. I regularly use 3 separate Atari systems, my Mega STe at home, my TT at work and my Falcon at home. I've got plenty of other nifty stuff to sell though. Anyone want to buy a massively comprehensive Spectre kit with ROMs, spectre GCR, drives, Spectre 128 and a LOT of software including MacOS with original pamphlets and manuals?

beta.

I don't believe it! A reply from you that ISN'T calling me every dirty name
in the book and saying how many children of mine you've fathered or...

It's so unlike you!

Have you gotten saved or something (things like that do tend to change a
person radically)? It's so unlike you!

But I definately have to say I prefer it!

Uh, but getting back on topic...

Who cares what I want to do with it... if someone has one and wants to sell
it, I'm offering to buy it...

BTW, are you serious? You actually have a uITX (or whatever those 6.5" x
6.5" square motherboards are called) in an STe case? There must be a lot of
empty space and port holes open... not to mention the modification to the
case to even make the uITX motherboard work in the STe case, since the port
layout is vastly different.

All STEs are not the same inside.

Variations include:

surface mounted or socketed chips,

combined or separate glue and blitter chips,

28 or 32 pins TOS roms,

TOS 1.06 or 1.62,

Simm or sipp memory, socketed or soldered

Its besides the point if they care, its right and proper to ask. How would
you like someone assuming some of your intellectual property has been
abandoned and then discover someone using it?.

Loads of space, just had to cut some of the sticky outy bits off the top,
all ports are taken to the rear of the case with extender leads, looks quite
cute running magicPC, and Office XP side by side!.

BTW, how are my kid's, did i miss another birthday?.

I have a keyboard (looks new) but I don't know if it is for a 1040.
You can have it free but pay postage. Ser# C070236-011 (Japan). Sticker
under board might be a date: 86.1.25 (Jan 25, 1986?). Pay by check ok!
reply here or by removing NOSPAM from my address!

Are you looking for an Atari ST (old style without the built in drive
and power supply or a STf with the power supply and drive built in? I
have a couple of both types. I also have the cake-box type Mega case
without a motherboard (put the MB in a PC type case). I'm in the
Milwaukee area.

Hi,

I have a fully functional North American Falcon 030 in good condition (no yellowing, no scratches, floppy works great) with following extras:

- hard-drive kit + 3GB 2.5" Hitachi HDD - installed
- 68882 FPU - installed
- TOS upgraded to 4.04
- 14MB RAM (Wizztronics board)
- VGA adapter
- Composite (TV-in) adapter
- Original Atari mouse

How much this think might worth on eBay?
If someone will make decent offer, I might sell directly.

I was thinking of learning how to use this platform, but then I relized that there is no Atari software design scene, just few greedy bastards (especially HDDRIVER guy). So Falcon wasn't great idea. PS2 Linux works way better for me.

So use this as your chance to get this legendary piece of machinery ;)

e-mail me at d h a u at m s x dot r u

Thank you

> users if they want support for HDDRIVER to be continued.

Wow! Hey good to hear from you! No, not to worry, I don't ask for what
I myself haven't already paid for, at least so long as I see there is active
support for the product. And I certainly wouldn't be asking for a
replacement copy of something in a public forem like this of a product that
is still supported if I did not once pay for it.

And not to worry, what I got was what I had, and far from 8.11. :)

However, the reason why I'm glad you're here... there are a lot of
people who would like to get ethernet going for their Atari ST/TT systems
but I think are a bit intemidated by the prospect of, well, not having a
built in Ethernet port. To matter the fact, I have met many people who can
tell me an Atari TT030 backwards and forwards, but the mention of Ethernet
gets back a response of "Never tried that mate! Always wanted to." :)

I managed to find a Dayna Port SCSI link-T, a SCSI to Ethernet adaptor.
I've heard that HDDriver can handle Ethernet through such a device like
this. Is this true? How does this work? And what compatibilities were
overcome between the series 7 HDDriver and the series 8 HDDriver?

All this to say, I have a copy of HD Driver, bought years ago. (and
unfortunately died shortly after I got it) I've looked around here in the
states and find support for the current stuff, and have not found it. Any
information you can give on your latest product will be very appreciated as
I consider sending money across the pond.

Take care!

I paid for my copy. I suspect most Atari users who care would do the same. HD-Driver is quality software. Plus if you buy Uwe will probably send you more than one legitimate version (i.e. some packages have problems with 8.11 but I also have 7.93). If you're over 16 or so, you can have a job and there's literally no excuse. $35 isn't too much too much to pay for a fine piece of software. I intend to make a bunch of anodyne software my next purchase.

PS: Uwe, any chance on getting a patch to get MagiC to boot in 256 colors on a Falcon? It would be really nice, ICD let this be set.

Haha, the best of Atarian elite stepped out. A good citizen of helpful community. No wonder no one is interested in Atari machines in Toronto. No matter how good the platform is, if community sucks, the whole platform doesn't make any sence.

New Falcons? Oh, please! Don't do so much crack, you silly hippie ;)

I'll sell it on eBay, if no one here will come up with good offer. So, go jerk off, lonely boy ;)

BTW: I don't think Uwe should give away anything. It's just surprising that the whole community is so gay, it didn't even produced freeware IDE driver. Best Falcon coders made a couple of inferior and uber-cliche demos. And those are the best. All the other just use the computer! WAY TO GO!

> >PS: I'm in Toronto, Canada

Well I swapped a PS from a 520STfm and it did the same so the PS is fine.

It must be the RAM at this point.

$35? Nice price, where is it being sold for that? (Saw it for 30 pounds
on the one place I could find it which is roughly $60 U.S. last I looked).

I'm sorry, but I don't intend to add too much OS-specific code to my
software.
The resolutions used for booting is set up in the NVM anyway, isn't it?
Or does MagiC use another resolution regardless of these settings?

So, that makes Atari a French company, doesn't it?

Funny that before Atari turned French, Atari was a purely American company (and allmost dead), but now that it is French, all product information can be accessed from around the world.

> The Atari legacy of innovation lives on!

So, the Atari 2600 is coming back for it's third life? Or are they finally going to make a console that can compete with the rest? I do hope so. I also like the idea of finally having some innovative games again, when are they going to come out?

There's more than one newsgroup? Well I'll be blowed! Off at a tangent,
people will put you in their outlook address book (the buggers) and
when they get the inevitable infection, so do all their close, and not
so close, friends. Even complete strangers may need to be contacted and
made aware of suitable anti-viral measures.

If it was an actual book that I wrote and made money off of, I would care.
If it was a catalog that I sent out for free to people who would potentially
purchase items through it, I would be flattered that someone would want to
put it up online a decade after it came out, provided that people didn't
modify it in an unflattering way. I seriously doubt Clint plans on doing
such a thing.

I am glad that there is someone that is still supporting the ST series
regarding HD driver software. I don't think it should be free, but I do
think that updates should be free. Unless the version is a complete
overhaul or something. ie from version 7.0 to 7.9 should be free! 8.0
should cost a upgrade. I know that dealers in the states are tired of
having to pay for each little update.

Straight from the camel's mouth, Uwe Seimet. I think I may have paid $40
or $45 for exchange rates, plus I received german application and german
manuals as System Solutions owns the rights to the English manuals or
something like that (could be wrong).

MagiC doesn't seem to really care about what is set in the NVM on the
Falcon in particular. MagiC will use ST-High on the Falcon with
HD-Driver. Problem is is that in order to fix the system so that this
will work, the only place to install such a patch would be inside the
MagiC kernel (gasp), or inside HD-Driver. An auto program will run too
late.

Jos,

Can you elaborate where these settings are at? Inside the Magx config file? Inside of Magxdesk? I have never seen ANYTHING similar at all.

Thanks

> TIm

Tim,

It's a low density sim-less upgrade. I have to test to ensure that it is actually 4 megs of RAM but according to what is printed on the board and the fact that all banks are filled, it appears to be 4 meg. I believe it is soldered to a few chips and it is in a 1040ST. I will examine compatibility. If I sell I will leave it soldered to the chips it is soldered to and then perhaps it will just be able to plug right in for you.

Commodore may be a different story. As a company they may lose certain
rights by not fighting to stop someone from posting their IP. IIRC that's
the way the laws work in SOME instances. As a result, commodore may have
a blanket policy that disallows all use, or perhaps they would just really
care about having permission. The chance of Toad computers moving from
their profitable business position now back to retail atari sales would be
laughable. The situation is different, there's good intentions involved
and no defamation. I know the law is the law but still.

>Magic at? and what versions?

You can get the latest, 6.20, from Atari Workshop in England
info@atari-workshop.co.uk - take a look at their web page
www.atari-workshop.co.uk

>(as if I remember correctly, you need all that goodness to actually
>use CAB, yes?)

Not necessarily - WDIALOG may be needed instead though.

>4)Does anyone know if the Falcon can read DS disks? I just won some
>games (ST) and the falcon
>doesn't read them , at all. Possibly bad maybe?

Sounds like it: the Falcon can definitely read double-density
double-sided disks - probably single-sided ones too,

>6)Is there a program out there that can let you (UN DELETE) and Detect
>undeleted files on the Falcon hard drive? (Something like the dossy
>machines had... undelete *.* which would
>show you files that were previously deleted? Or maybe some other means
>of recovering data
>that would have been previously deleted?

There are several: Diamond Edge and KnifeST (commercial, but Knife has
been on a cover disk) will do this, but neither are happy with very
large partitions or long filenames. OK on floppies with 8+3 filenames.
There is also the PD UNDELETE.PRG and UNDEL.TTP, though I can't get
these to work wih or without MagiC on a Falcon at all - the first
complains it can't allocate enough memory (even though I have 14 MB)
and the second crashes with 2 bombs. ST_TOOLS.PRG is also supposed to
be able to recover files but I can't get this to work either :-(

>8)What's the biggest size HD (internally) I can put in the Falcon? Say
>I get a 1gb HD, do I have to partition all that good stuff? Software?

With HDDRIVER the biggest drive size is 1 TB! But individual
partitions can only be up to 1 GB (with Magic) and you can't have
more than 26 of them (some other OSs allow another 10). My Falcon
has a 6.4GB 3.5" drive in it - this just fits over the shielding,
using an adaptor from Abingdon Synthesis Projects (mail them at
chrisc@zetnet.co.uk) for the connection. Such drives are *much*
cheaper than the 2.5" drives fited as standard.

>>
>> PS: Uwe, any chance on getting a patch to get MagiC to boot in 256 colors
>> on a Falcon? It would be really nice, ICD let this be set.

Jos, Mark and Uwe

From previous postings, I think what he meant was that he wanted
the MagiC boot-up image to come up in 256 colours - the one
referred to in MAGX.INF by image=C:\GEMSYS\GEMDESK\PAT\256\MAGIC.IMG
AFAIK this appears before MagiC itself is loaded - not sure if the
NVRAM settings referred to by Uwe have any effect here. Apparently
the ICD driver allows this. With HDDRIVER it is always dithered to
mono.

Personally I comment the line out with #, as it just slows down
the boot process!

Regards, /Peter/

> going to come out?

Uh, no. Infogrames (I don't care what they call themselves, they are
not ATARI) is strictly a software company. We've seen the ATARI
multi-game joystick thingy and an Activision gamepad doohicky
(Infogrames owns the Activision name too, I believe), but those were
licensed items produced by another company (Jakks Pacific, iirc). I
think it'd be really cool to see an even smaller 2600jr, or maybe the
same one again, but I doubt there will be any more cartridge-based
consoles bearing the ATARI name, and you can pretty much bet that this
incarnation of ATARI is *not* going to move in and challenge SONY and
Nintendo with an up-to-date console, either.

They're basically just trying to get a return on their investment, and
I don't think that was happening fast enough with the "classic" titles,
so now stuff like Enter The Matrix is being sold with the ATARI logo on
it (probably because ATARI is "hip" again, hence all the t-shirts,
etc.)

At any rate, it's all hype and very little substance. How very 21st
century.

> etc.)

If you knew anything about the current Atari, you'd know that they have
always valued the Atari name and began using it on their high-profile titles
almost immediately (but without a lot of fanfare). Highly thought of

titles such as "Neverwinter Nights", "Ikaruga" and "Godzilla: Destroy All Mosters - Melee" all carried the Atari brand (some crap did too, but what else is new in the world?). As the then Infogrames built up the profile of "Atari" as a name for modern games, they finally decided to take the mantle on themselves. And I don't care if they are still primarily French based, they are as worthy a successor to the Atari of old as anyone else. I'd rather have a company named Atari making games of all kinds for people to play then it just being a bunch of properites shuffling from company to company, stuck in people's minds as a thing of the past.

> At any rate, it's all hype and very little substance. How very 21st
> century.

I fail to see why this is hype. It might have been hype if they had no games to back the move up with, but the fact is they are very successful right now, both critically and commercially. (Not always both on the same games, but, again, what else is new?) It seems to me that the current Atari has a greater degree of respect for the Atari name (if not necessarily the totality of it's history) then you (and all other "new Atari" bashers) do. You would seem to only be happy if the Atari name was dead and gone, relegated to the ashcan of history. It's like you're jealous of anyone else getting ahold of "your" Atari.

Wake up, son.

Atari lives.

Atari started out as a game company. Only later, making computer (which, to me, were the well-equal of the gaming division). They're simply back at square one... gaming, just no "Atari hardware" to run it on. No arcade machines. No computers. No consoles.

But I honestly believe that, now that Infogrames has, in near totality, taken on the name of "Atari", we who would desire to bring back the "hardware" portion of Atari's legacy, are much closer to that goal than ever before.

We need only present a reasonably iron-clad plan of action and a prototype product. If all of Infogrames' (now Atari, Inc.'s) software subsidiaries are now called "Atari", what makes one division any different than another? Could not one or even two of them be devoted to writing software (apps, utilities, games, etc.) for a new Atari computer? Surely so! If Atari, Inc. has no desire to design or make hardware, let those who have the desire...do so!

I will write another message around this topic, for I am fired up once again to purpose!

Atari is more alive, as never before, since the selloff from JTS to Hasbro and then off to Infogrames. What I once dreaded (the endless "namebrand graveyard scenario") has been decimated and the name once again holds substance and vitality!

"Atari" is "Atari" to me, so long as it is a company, right and proper. Atari is now a company once again (I really hated the languishing years between Hasbro and Infogrames, where "Atari" was nothing more than just another namebrand slapped on a game box), regardless who runs it and under what guise it is named therein. It may not be the Atari of old, wherein the 2600VCS and Atari 1040ST I loved so were created, but it now has substance again. Atari has presence (street addresses and phone numbers and URLs). And, as an added benefit... it has instantly returned... across the globe!!!

From: John Kavanagh <johnkavanagh@cpcoxygen.net>
Message-ID: <bdb4bigpf1@kermit.esat.net>
Source record: 26070

Your input for the perfect computer!

I'm the long time user of the Amstrad CPC and runs a online
magazine called 'CPC Oxygen' at www.cpcoxygen.net which is totally free to
view online which also contains past issues of Amstrad Action (with
permission
from Future publishing).

What does this got to do with Atari ST

Well, we are currently working on a new article for the next issue (Summer
03) discussing what would be the perfect computer, in terms of operating
system, hardware, design, style, price etc. with current or near-future
technology etc and we like to get the input from as many users of
alternative computers and operating systems as possible.

We're looking for anything from full blown thousand words essay to just a
few lines or even a graphical drawing. Even just an innovative idea (such as
having the OS on a ROM cart, with only drivers and other modifications
located on hard drive, allowing for easy upgrade and reducing piracy) would
be great. Basically anything you want.

It you that decides what direction the article takes, perhaps the perfect
computer is already with us, if so why?

So basically any input would be great :-)

Once the article is put together it will pit not only onto the next issue of
CPC Oxygen but any other online magazine/website/publication that request it
(as long as credits remains) as it will be of interest to many fans of
alternative computing.

Forward your ideas, text, drawings to johnkavanagh@cpcoxygen.net

Thanks,

John Kavanagh
Editor
CPC Oxygen

Don't kid yourself, it ain't gonna happen. If they had to bring
someone else in to create the little joystick thingy, they're not gonna
be able to create a console anywhere close to the PS2, GC or Xbox.
What will sell product now is the name, not the fact that Atari made
lots of 8-bit consoles and computers. No-one cares about that anymore.

But why does setting the resolution from the desktop does not work. I
never had any problem with the screen resolution with a Falcon, MagiC
and Jinnee.

4092. The rebirth of Atari... hardware!

Newsgroup: comp.sys.atari.st
Date: 2003-06-25 05:25:06 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <umaKa.78480$Pc5.74837@fed1read01>
Source record: 26073

I'm sure many of you remember, lo those many months ago... nay... maybe a year or more... when I was going off on my tangents trying to fire up enthusiasm on "reviving Atari" (which was but a mere brandname shell of it's former self). One such proposal was to purchase a license to the name "Atari" and create a company from it. This never happened and, t'was pointed out, not too likely to ever happen because any slipup in the "Atari hardware division" might otherwise negatively impact the parent company.

Today, this is no longer an issue. "Atari" is now a company... across the globe! Goal accomplished... at Infogrames expense. Free of charge to us. Did I (or anyone else with similar dreams) have any effect in this change? I don't know. I'd like to think I, perhaps, planted but the tiny, albeit quite enthusiastic, seed that was watered and nurtured by the corporate higher-ups. But, regardless, the result was the same... company created.

NEXT!

If one looks to articles and interviews of those within Atari during it's hey-day, one will realize just how much difficult work the 'Tramiel Clan" had to go through to get where they were going. The article I enjoyed reading (just today) is this one:

http://www.atarimagazines.com/startv3n1/threeyearsofst.html

It shows the struggles and deadlines they had to meet. It shows what they started with (nothing) and how they evolved to the ST we know of today (CP/M-68K was originally going to be the foundation for GEM to stand upon, but they switched to GEMDOS in the 11th hour... and had to really cram (what with the deadline looming closer and all) to port it to a processor it wasn't written for (the 68000)!) Was it ultimately the right choice? Could they have done better had they stayed with CP/M-68K? Surely, they would have saved time, since it was already available for the 68000 processor. We will never know. The choices were made and the product was forged.

And, with the exception of porting GEMDOS/GEM to the 68000, the only thing Atari made of their own, was the computer itself! They used someone else's OS! And thankfully, it wasn't Microsoft Windows, either! Whew! :-)

But even this is not an issue today. The hardware is already available, unlike back then. The OS is available, just like back then, but significantly more capable than GEMDOS, to say the very least.

All we really need to do is work on the OS... update it, add to it, improve it. It's already written for the processor.

If we were where the Tramiels were, with the advantages we have today, the Atari ST would've been created in a matter of weeks, not months nor years,

because the only aspect they'd have had to create was the case!

If we give up the idea of "advancing the past" (basically what all cloning and add-on efforts are doing) and put ourselves in the position of simply wanting to create a "new Atari computer", we have 90% of the work already done for us! To satiate the loyalists, we write/port an emulator that runs "legal apps" (those programs that don't call hardware directly and such). I know there was/is an "emulator" for the ST/PC (I forget which) that did this. I can almost remember the name, but not quite. Geneva?

At any rate, this simple emulator would hopefully allow programmers to run and port their GEM apps from the ST of old to the Atari computer of new.

I personally am holding out for development of a GUI (a "theme" for the GUI, if nothing else) for the OS that I would like to look enough like GEM, at least enough to be familiar... and call it "GLUE" (GEM-Like User Environment). This would help transition people from the old look/system to the new look/system.

Ok, enough about the computer for now... lets discuss the business end of things. As well, let's also intersperse a few basic, if not ultimately entirely realistic, assumptions, just for the sake of doing so:

1) "Atari, Inc.", as it stands today, does not make nor sell computers, nor may ever have any desire to do so.
2) We want to change that.
3) "Atari, Inc." is not willing to spend any of it's money or resources to do anything other than write software.
4) We have the money, resources, and interest
5) "Atari, Inc." still owns all rights/resources to all the old ST materials, except TOS/GEM (to my knowledge).
6) We only want the molds/mold plans/rights for the 1040ST case design and are willing to pay to have/use them.
7) We "prototype" a very affordable unit, for less than US$1,000.00, "hacked together" from an existing motherboard, existing OS, added-on GUI, and cram it into a 1040ST case... just to show.
8) We present it to "Atari, Inc." with the following details:

a) We built the prototype computer for Atari, Inc. at no cost to them. We did it as a labor of love to show our desire.
b) We ask them to try out the prototype, see how they like the feel of the OS and give it a test run.
c) We ask them only to open up a small area on their website, letting people know that "Atari, Inc." is potentially considering a possible foray into the computer field again and show off the preliminary drawings, ideas, and progress made thus far, etc.. This area would also ask if the viewer was interested enough to possibly buy such a machine and what price point they would be willing to pay for it, etc. Rabid (i.e. VERY enthusiastic) word of mouth lets people know about the "new developments" at "Atari, Inc." so that they go and offer their input iover at Atari.com.

If it doesn't pan out within 6 months (a very low showing of interest), then the idea is scrapped and we call it a nice try. "Atari, Inc." has lost nothing financially and resumes business as usual.

This is the first stage... stage 2 (next message) will assume that "Atari, Inc." has recieved a significant user response to warrant their serious consideration towards the new computer and decides to begin "making computers again".

The problem isn't with booting to the desktop. The problem is the Magic "splash screen" that comes up immediately after loading HD Driver, while the other AUTO folder programs are loading. Instead of seeing the words scrolling up the screen, you see a nice "MagiC 6" logo and a background pattern of your choice, while the words are saved to a log file. The only way so far to get Magic to boot with a higher-color splash-screen is to run the ICD driver (yuck), which allows you to switch the boot-sequence resolution/color mode through the driver itself. Otherwise you're stuck with ST-High until the GUI starts up. I personally don't mind now that I tried this with ICD, and saw how dead slow the boot-up sequence was compared to ST-High. However, if someone has a quick accelerator (CT2, Afterburner, CT60), I'm sure the speed reduction would be minimal. In that case, I would definitely want the higher color option.

One option, I suppose, would be to have ICD on the boot sector, and HD Driver in the AUTO folder. That way, it would start up with ICD, switch resolutions, then immediately use HD Driver. Would this work? ICD is the only one I know of that can change resolutions immediately after loading. Anyone know another?

Absolutely. My favorite game then, my favorite game now. That, and the red
hair I used to have back then that sadly now has aged to auburn. :-(

Started using it on AtariAge when it switched over from being 2600 Nexus and
it has basically become my Internet identity. As far as I know there is no
one else who uses it, so if you see a "Rhindle" somewhere, it's probably me.

Hi Galen,
A glossary would be nice. I can figure out the basics like "new game",
"quit", angles and force, and who shoots first but there's a lot more!
My German/English dictionary (got from somewhere on the net) is too far off
to make sense so I let the game set the parameters (different each loading).

It might work but using more than one hard disk driver is not a
recommended way of usage and I would not risk losing data that way.
Setting screen resolutions etc. is not something hard disk drivers are
responsible for and it would mean more platform-specific code in
HDDRIVER. This is why I won't add code that manipulates the Falcon's
resolution to HDDRIVER.

Another thing that just came to my mind: The ICD driver supports an
outdated version of the XHDI specification, doesn't it? If it does
starting another driver with a current version (i.e. HDDRIVER) will
result in this driver also to use this outdated version. In other words,
some XHDI functions are not available that way. When there are two
drivers installed with different levels of XHDI support only the lowest
level is available.

Source record: 26080

Part 2 (er, Stage 2, I mean)

Let's assume, that there has been an interest of 1,000 individuals (there was for the new AmigaOne/AmigaOS 4). They're willing to pay $1,000.00 each for this new Atari computer. 1,000 buyers at $1,000 each equals $1,000,000 dollars.

Ok, I mentioned earlier that it should cost us less than $1,000.00 to build the "prototype", correct? This is true. At least considering the hardware aspect (case, motherboard, media drive, internal hard drive, etc.). Financing the changes and improvements to the OS is a one-time expense that gets us where we want to be for the prototype. This could run $1,000 or more, depending upon who we get and what they want, to do the work. Initial software development will also require some extra finances. Using generic PC cases will eliminate the manufacturing aspect even further, but... leaves us with generic looking Atari computers... not a good way to restart the computer division, I think.

We now have a potential $1,000,000 in orders ready to be taken. "Atari, Inc." likes our prototype and believes in our vision. We ask for a small, one time compensation for prototype expenses, plus enough startup money to begin parts purchasing and begin assembling/selling the new Ataris.

Advertising for these new computers is solely web-based. Banner ads. Link buttons. Word of mouth. Web sites, etc. All very cheap, if not free.

The actual computers will most likely cost us less than $500 for parts (one-offs... less, if we buy in quantity). The OS is already paid for. So, if we assume half of $1,000 is knocked off for parts costs, we have $500,000.00 initially. If we assume we have 10 people, paid $10/hour, working 8 hour days to assemble these Ataris, we have $800/day labor costs. Multiply it over a 5 day week, for $4,000/week. Multiply it over four weeks for $16,000.00/mo. So, in the first month, we have an operating capital of $484,000. Not bad, methinks.

Now this is where "Atari, Inc." gets happy. THEY get the $500,000.00 We get the $10/hr. pay We make the computers for them and they get the money from it. They pay out very little and get in a lot.

An "Incentive Offer" could be that, if you trade in a Falcon030, you get $250.00 off the cost of the new system (or towards new software for the system). Computers like 520ST's and above are worth $25.00-$125.00 off the new system. We just toss the computers, but we get the sale!

This is for the US sector. Designing a version for overseas users shouldn't require much effort. Probably little more than a different power supply, I suspect.

"Atari, Inc." devotes one or two of their "divisions" to writing new software (games, applications, educational titles, etc.) for the computer, making even MORE money!

You see, my whole aim is give "Atari, Inc." the incentive to do something they wouldn't normally consider doing, by doing everything for them. Build the prototype. Buy the parts. Build the systems. "Atari, Inc." is actually still *just* making software... for PC's and now a new Atari computer! We're the ones helping them make more money by selling a computer for them! We put them in a place where they get money and further brand-name recognition while they do little more than what they've been doing all along... just a little differently.

Our investment in time and money is a risk, no question about that. "Atari, Inc." might not care. No one might care. But you can't prove something unless you risk TRYING to prove it.

If I had the money, I'd do it all myself. I'd hire the programmers for the OS. I'd buy the prototype hardware. I'd put it all together and present it myself. No question. I'd gladly spend all my money and end up being shown the door by an uninterested "Atari, Inc.", if it meant I had at least TRIED! But I don't have the quantity of money necessary. And, thus, what *could* be, may *never* be, if we don't at least TRY!

Then again, maybe "Atari, Inc." will pull another rabbit out of it's hat and do all this for us a few months/years down the road... like they did when they changed their name from Infogrames TO Atari, Inc.!

But agreements are hard to reach. Some want one thing. Others want another. Yet others couldn't care less and don't want to get involved and boo the whole idea. But just remember how the Tramiel Clan did it way back... they agreed on a plan of action and set forth to accomplish that plan, come hell or high water... and they MADE IT! Five months after aquiring Atari, new Atari computers were unveiled! We haven't anywhere NEAR the amount of work they had to go through... nor the expense...

Which boils the sap right down to syrup... are any of us willing to agree to a plan of action to begin this journey? If not, then all we will ever have to keep us going is to keep "advancing the past" on our ever further aging Ataris.

But, for me... I remember the past, while living in the present, and keep dreaming of a bright, new future. And that future has "Atari, Inc". written all over it!

I'm sorry, did you think it was a philanthropic organization? Of course it wasn't *just* a game company, it was the *best* game company. But still, a game company.

> How would you like it if some guy grabbed a camcorder and re-did Plan 9
> From Outer Space in his back yard because he wanted to "continue the
> tradition" of Ed Wood, who was nothing more than some guy who made bad
> movies?

Well, the fact people still talk about him proves he's more than that. And people have "continued the tradition", both authorized and not, with varying degrees of success. Check my Site, in the "Beyond Ed" section. Quite a lovely thing, I think. That people would want to bring forth more of Ed's work now that he can't.

>I don't think that would sit too well.

There are, of course, those who agree with that sentiment. I'm not one of them. Only shameless latchings on like "Barely Legal Lesbian Vampires" annoy me. Real attempts to bring new works of Ed's to the public are always welcomed by me.

>To debase something by
> perpetuating the myth that it really was as one-dimensional as it
> seemed is NOT "respect".

Not sure I understand this point, but maybe I do. In the case of one Ed-related film, "Devil Girls", the filmmaker purposely did things wrong, like had scenes out of synch and had the film break. This *was* annoying and *did* seem to insult Ed by doing things on purpose that Ed would never have done intentionally.

But I fail to see how this relates to the issue at hand. The new Atari isn't debasing the old. What would be the point of that? If you are talking about the recent "video game history is HISTORY" line, that's really getting blown out of proportion. One of the main problems facing Atari is

that most people still think of it as being a name from the 70s and 80s. Atari wants to let people who don't already know that Atari's place in history is now no longer settled. Atari is alive and well and has games for them to play.

The main problem with your Ed analogy, though, is that Ed was a person. Atari, no matter how we may have loved it, was always a company. It didn't stop existing when Nolan sold it to Warners. Nor when he left. Nor when it was split in two.

But Atari *did* die. Twice, in fact. The first death occurred with the JTS merger. JTS was not a video game company and had no intention of becoming one. Atari Corp. died and was reduced to a bundle of assets to be bought by Hasbro, then by Infogrames.

The second death was when Midway closed Midway Games West. Midway Games West, as you should know, had been Atari Games Corp. for many years. Passing from parent company to parent company, but always making arcade games. When Midway got out of the arcade business, the by then renamed Midway Games West really became superfluous. Atari Games Corp. is now reduced to what Atari Corp. was: a bundle of assets (in this case, owned by Midway).

And now Atari is reborn. The new Atari is what, at heart, the original Atari was: a video game company. Hardware was the main route the old Atari took because in those pre-Activision days, no one thought any other way was possible.

It's funny how the notion of the new Atari going into hardware is always the first thing people think of when they hear the news about the name change. But to me, Atari wasn't mainly about the 2600 or the 8-bits. The 2600 is my favorite console at least equally because of Activision as because of Atari. Atari to me was about "Asteroids" and "Adventure" and "Missile Command" and "Star Raiders": the games. And not just the originals. An important part of the old Atari were those licensed games: "Raiders of the Lost Ark", "Superman", and, yes, "E.T." And not just the games for Atari systems. "Donkey Kong" or "Defender" on the C64 or TI-99 4/A. "Centipede" on a VIC-20.

And the new Atari is *that* Atari. Not the one that dominated the console and arcade worlds, but the one that makes all those games. All those different games. Racers, fighters, RPGs, shooters, kid's games, etc., etc., etc.

Infogrames spent twenty years building up a solid reputation in the gaming world. They've had their share of crap, of course, but generally they are respected. Throwing away a name you've spent years building to take on the name of another, I think, shows tremendous respect.

I'm rambling on here. I don't think I can convince you to see this from a different perspective, so I'll just agree to disagree with you on this.

I certainly agree with the idea that Atari will not be making any kind of
console or computer. I don't agree that they *couldn't* (theoretically
anyone *could* make hardware, you just need the right design partners) but
that they won't. Unless you're Nintendo, there's no money to be made in
hardware. And Atari doesn't have the kind of bankroll to even think about
trying such a thing.

But could you see *something*? Well, maybe. Gizmos and wacky little
handheld thingies are very popular these days. Heck, that Atari joystick
got almost universally lukewarm reviews and sold like crazy. I could see
Atari doing something like that. Partnering with a company to make a
doohickey to play either old games or new games based on their current
series. I'd be surprised not to see some Atari branded LCD games (beyond
those titles MGA keeps recycling) or more self-contained units like the
joystick.

Hi,

I have a problem with Connect on MagiC PC and ISDN.
I can establish a connect to my maus-Mailbox, but it results in
strange signs on the screen but normal letters, and the mailbox
doesn't seen to recieve any inputs from me.

How do I have to change the settings in Connect?

Greetings

Ingo Dehne

4104. 520ST no power!

Newsgroup: comp.sys.atari.st
Date: 2003-06-25 07:48:18 UTC
From: Tim <tjlazer@nospammail.com>
Message-ID: <vfiku3noqs2vfa@corp.supernews.com>
Source record: 26084
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My 520ST seems to be dead! It was running and when I came back into the room the computer looked turned off. But was switched on. Black screen and no leds on. It seems to be not getting any power! Can the PS be dead? It is the large Atari external PS. It is a 7 pin female connector.

Is there a way I can test to see if the PS is bad before I shell out $40 for a new one? I noticed that the SF 354 had a similar connector but only 5 pins, the 520 PS has an extra +5 and Ground, so I plugged it into a old SF354 and the drive made a weird noise, just like a bad SF354 PS I had! Should th drive work with the 520ST PS? This would be a good test since I have no volt meters or the knowledge to test the PS at this point!

Any help would be great.

Atari ST forever!
Tim

4105. Hack a PC P/S to 520ST?

Newsgroup: comp.sys.atari.st
Date: 2003-06-25 08:07:51 UTC

Can someone provide some guidance on how to adapt a PC Power Supply to connect to a Atari 520ST? The one with no Disk drive that requires a external PS! I know it needs +12, -12, +5, and -5 and Ground, is that right? Can I just splice up a cable and connect it to the 520? Not really qualified on this type of thing but am willing to try!

Thanks!
Tim

I really don't think you're getting the point, or you simply choose to
ignore it because it doesn't support your opinion. I think Curt Vendel
would have something to say about the issue, and it would probably be
closer to my point of view than yours. Regardless, if you're just
gonna do games, you might as well call it Syzygy, because that was just
a game company, and while their best games were made under the ATARI
name, "ATARI" grew to be much more than just a game company, in spite
of the fact that all they're remembered for now is games. Similarly,
Ed Wood is only remembered for making bad movies, and I think you'd
have a problem with anyone who said that's all he was.

Call Infogrames "ATARI Lite" or "ATARI stage one", hell, even "ATARI
Games" (Grames?), but the ATARI of today is but a lingering shadow of
what ATARI once was. I should point out that I'm glad that shadow is
still there, but I think there's a very good reason some people are
expecting them to go into the hardware field, which I doubt will ever
happen again, much like poor SEGA.

Not to be pessimistic here, but I doubt we'll even see Joystick II,
although something that plays 5200 games would be nice. Still, would
anyone in their right mind (in the key demographic, anyway) buy
something that looked even remotely like a 5200 joystick? What would
the warranty be on that -- "guaranteed to break or your money back"???
I can see it now... "ATARI 5200 10-in-1 'joystick' TV game -- with
authentic 'intermittent operation' mode".

Message-ID: <S8fKa.2991$ps6.405259@ursa-nb00s0.nbnet.nb.ca>
Source record: 26090

In today's market of big box stores and product standardization, we are starting to see small niche markets show up for, say, coffee, hybrid cars, specialty cable channels etc. These are items that have a small market but charge premium prices. I myself would pay a little extra for a new an unique product (yes even a new Atari). Learn from the Atari clones, get some input, use off the shelf hardware if you can. You cannot try to compete with the big guys. It is like the independent artists in the recording industry, they do well on their own, but probably do not have the volume that a Sony has.

It's not likely to be a problem with an outdated manual, but why not ask
them if for no other reason then to be courteous? Amiga Inc. gave me
permission to put the information online but requested that I ask them
specifically for each additional copyrighted manual want to put on my
website.
That is a reasonable request IMO.

On behalf and request of Rodolphe who wanted an english translation for his
today's communication on the french newsgroup, I am glad to share with you
the following message. I tried to stick to his text as much as I
could but please forgive my mistakes in translating (I am only a french
frog, no native english speaker!),
and possible misunderstanding. Here it starts:

I have recently seen (mainly on the french newsgroup) loads of discussions
about the new SuperVidel or a PCI bus for the Falcon.

Some have even stated, that I had given up the PCI bridge. They are wrong.
For the time being, I have been thinking about numerous solutions including
:
- a DSP 56002 card on the CT060 slot
- a SuperVidel card with onboard PCI and DSP
- a CT62 card (second version of the CT 60). (I guess 68060 + 56002)
- an ATX motherboard including CT60 + DSP + PCI + USB + SUPERVIDEL

Clearly, a micro-atx motherboard would be much more attractive in
terms of cost than 3 or 4 small ones stacked on top of each other. In this
case, it is of primary importance to think about the targeted market for
such a mother board...because according to me there are not enough potential
customers among the Atari community itself.

The world of integrated and embedded solutions is the best choice for a
68060 which can evolve wether towards the Coldfire processor for which not
much
rewriting of code is required, or towards the PowerPC for which the work for
rewriting the OS would be tremendous but very worthy on the long term once
done!

I want to remind you that most of the companies who dealt with the 68K
processor are gradualy moving to the Coldfire which code is more or less
compatible (Motorola offers a free and open-source code parser AND emulator
meaning that not much would be required for code translation)

There are nevertheless numerous companies still using 040 and 060 processor
based solutions and a 68060 motherboard including modern peripherals such as
SDRAM could have a chance.
With a small 68k-family based motherboard, one can make a lot and this for a
lot of
customers because once an application is developped, one simply needs to put
it in flash memory and sell !! Clearly, the Coldfire would be a much better
solution than a nowadays very expensive 68060. Since the bus protocol is

identical between a 68060 and a Coldfire, one can easily imagine a daughter card for the CPU! Or even start with an onboard 68060 and plug a Coldfire on a daughter board.

I want to give now a few more details about the CT60:

I spent the two last days of development of the ABE on modifying the system in order to allow the adjunction of a 060 Slot card at addresses already used on the Falcon!

Why that?

In order to be able to replace the hardware of the Falcon with a much more powerful one. I can give two immediate examples :

- SuperVidel replaces the Videl whil remaing 100% compatible with the other addresses. No single patch is required for the softwares! The only thing is to change the address of the VIDEO RAM which because of its size larger than 14MB may not live in the ST-RAM anymore. One can otherwise limit the ST-RAM to 4MB and give the SuperVidel a memory allocation of 8MB.
- Same thing for the DSP56002 !

One can also make a new SDMA running 32bits - 66 MHz instead of its actual poor 16bits 16/25MHz.

The mechanism which allows such a hardware emulation is not magic, it is indeed fairly simple : a the beginning of an access of the 060 at a Falcon address, a time window of 7 cycles of the 060 Clock is available for a slot card to acknowledge.

Once the 8th cycle is reached, it's too late and the access is processed as on a normal Falcon. If the slot 060 answers (TA), then the Falcon access does not occur. Quite easy!

Why these 7 cyles ?
Because 4+1+1+1 = 7. These are the required cycles for accessing the SDRAM in read mode at 66MHz. For example, an access from SDRAM to the Supervidel requires a write sequence which lasts at most 2-1-1-1 = 5 cycles.
I am about to add all these informations to the change log.

I would like to conclude with these words : EVERYTHING IS OPEN. I am expecting from you guys any "smart" proposal for a look in the future!!

Thanks for having paid attention....
Rodolphe Czuba

First: this is a followup to a crospost, so I leave it crossposting. Excuse
me french readers, I do not speak french/

I left only one line from the original message. It is an option that would
by chosen by me. With 3 ideas:

1. DSP is not critical (there is Desse) but could be usefull. Due to
compatibility reasons I would leave old DSP on ond addreses and add new DSP
on new addreses.
2. Why no USB?
3. Fast IDE controller could be nice too.

Does the 520ST need -12 and -5V? Im asking cos the 520STFM/E doesnt. If not
then its a simple question of using the reds on the PSU for 5, the yellows
for 12, and the blacks for 0.

Rudolfe,
I would say there is many important features that
should be implemented into a Falcon predecessor. If
using the STOCK falcon motherboard (RECASED of course)
I think these would be features most wanted.

SuperVIDEL
DSP 56002 / why not the 56301 like the Dessee card??
Speed or compatibility issues??
I aggree with Semper that a faster IDE controller
would be very nice on the Falcon even adding 2
channels to allow for 4 devices to be hooked to the
Falcon. This would allow people to do away with
slower and more expensive SCSI devices as the Falcon
cannot handle very fast IDE CD Burners.

Now what about a whole new Falcon with an ATX type
Motherboard with lots of connectivity.

USB 1.1, 2.0
Firewire
Coldfire Processor
SuperVIDEL
DSP
Super fast IDE bus

Make the Firewire and USB on a card/DSP on a card and
SuperVidel also on a card all seperated. Reason you
dont want these all integrated into the motherboard in
case one component goes bad it could be easily fixed.
Just my two cents.

Thanks,
Carey Christenson

Now we're getting somewhat into the goals of the ACP project. Certainly we shouldn't duplicate any efforts. I can offer with relative certainty that I will buy an Atari coldfire machine and all related accessories when they arrive. Maybe Rodolphe should consolidate efforts with this and since it is a new machine it should be faster to complete then something like the CT60 which has to work around problems with the Falcon. What do you think Rodolphe?

Thanks
Mark

Compatibility issues because the 56301 is not 100 % comptaible with the
56001 !
You need to write an emulator to be sure the register accesses of the old
programs will match the new registers of the 301.

Assuming the PC supply provides sufficient amperage (and I'd suspect
it does) it really is just a matter of connecting the proper wires.
The PC supply may need the +5V "always on" line connected to a ground
line depending on the model, but that's the only real difficulty. Try
to find a PC supply with an on/off switch if you can.

Galen

Well, I guess I took the bait from whoever it really is at suppsedly
"dot r u" who may or may not have a Falcon to sell!!! Sounds more like a
disruptor, maby due to the CT60's advancementm which is excellant for a
"legendary" computer :)

I'd wager that they don't need the -12 or -5. I know the MegaST
doesn't. Our computer club is going to be doing away with a bunch of
STs (the type with the external power supply). We could make you a
real good deal on a power supply and even an extra ST.

I won't be able to get to the computers until our next meeting though.
They are stored at the church where we have our meetings.

dave

Rudolphe,
Sorry about that... I meant successor. Typing
slower than I was thinking. LOL. Thanks for the info
on the DSP 56301. I was not sure if there were
compatibility issues with the 56301 compared to the
56001 and 56002. How much faster is the 56002 than
the 56001??? My biggest problem with the Falcon is
its limitations on amount of MEMORY RAM (wont be to
much of an issue with the CT60) , lack of CONNECTIVITY
to newer devices ex. USB 1.1, 2.0 and Firewire, need
for a faster Graphic Card with better compatibility, a
faster DSP to help with MPEG decoding and MP3 decoding
as well and lastly the fact that there is not enough
IDE channels that are fast enough to do CD burning at
40X or faster preferably 52X!!!! If all of this would
be possible that would be great!!!!

thanks,

Carey Christenson

Hello Rodolphe,

First congratulations with your CT60!

Regarding your thoughts:
I would love to have a new Atari Falcon with DSP soundcard, PCI and USB (Cartridge port, Midi and SCSI too of course). For the normal consumer the CT60 board looks far too complicated. What we want to have is a modern computer, ready to work straight out of the box. With a modern OS (Mint or MagiC), sinle TOS (emulator?) and all the applications to get you started. Read the open letter to ACP in MyAtari magazine.

For me it has to work with older programs, since new programs aren't there. I want it to work with Cubase Audio Falcon, it's the best program for that purpose available on the Atari. Once the new Atari Falcon Coldfire is there, a new audio/midi program should be developped, because CAF isn't new anymore. It can't do what Cubase VST/ SX can. It hasn't plugins and virtual instruments.

I want to buy this new Atari and don't mind to pay more for a machine.

Regards

Jos van de Gruiter

You're going to have to start actually making a point if you want me to get
it. You say the name change is "hype". You don't explain why. You say
there won't be a "Joystick II", but give no justification. I can't say I've
noticed any point to ignore.

> I think Curt Vendel
> would have something to say about the issue, and it would probably be
> closer to my point of view than yours.

I'm sorry, am I supposed to feel bad about that, if true? Has Curt Vendel
become the end-all be-all of Atari? If so, I didn't get the memo. I
respect him for all he's done, but his opinion is still just one man's
opinion, like yours or mine. And please don't throw someone else's weight
around unless you know what his opinion is.

> Regardless, if you're just
> gonna do games, you might as well call it Syzygy, because that was just
> a game company, and while their best games were made under the ATARI
> name, "ATARI" grew to be much more than just a game company, in spite
> of the fact that all they're remembered for now is games.

You're really going to have to explain this point of view sometime. Atari
is and was a video game company. What makes you think it was something
more?

> Similarly,
> Ed Wood is only remembered for making bad movies, and I think you'd
> have a problem with anyone who said that's all he was.

Again, I don't see how your analogy works. Ed isn't *only* remembered for
making bad movies. Especially thanks to the movie, he's also remembered as

a maverick, heart-felt filmmaker. Of course, he's *mostly* remembered for making bad movies, but that's not nearly the same thing. And, no, I wouldn't have a "problem" with anyone who said that's all he was. If I did, I'd have a "problem" with most of his fans! I may disagree and I may try to educate, but I realize that Ed's fans (like Atari's) all come at it from their own angle.

> Call Infogrames "ATARI Lite" or "ATARI stage one", hell, even "ATARI
> Games" (Grames?), but the ATARI of today is but a lingering shadow of
> what ATARI once was.

Well, obviously. But the Atari of 1996 was too, and nobody acted like they weren't Atari.

> I should point out that I'm glad that shadow is
> still there, but I think there's a very good reason some people are
> expecting them to go into the hardware field, which I doubt will ever
> happen again, much like poor SEGA.

Why poor Sega? Do you realize the company is profitable for the first time in years? It *is* too bad they had to get out of hardware, but that's just the way it goes. At least now, Sega will continue to make games, which is what they are really all about. Remember, Sega made games for the 2600 and other systems before they got into consoles.

What you don't seem to get is that companies change. Sometimes they have to. Atari went through a strange period before rising from the ashes. Sega had a bit of a harder road, in some ways. It had to go through it's painful transition under the glaring spotlight of an industry it once dominated. Atari did it in the dim shadow of obscurity.

Anyway, I really am tiring of this. Unless you've got something substantial and new to add, I'm off.

??? complicated ?
You can fit the CT60 without solders like a simple PCI card into a PC !
It's difficult to de simpler...

About the DSP56002, some 80 and 100 MHz versions were available if I well remember..
The big other differenc is that the host port may be acceded directly by the 66 MHz buis of the CT60 !
So with have 66 instead of 16 to 25 and 100 instead of 32 to 50 ....this gives a ratio of 5.28...
Not extraordinary but surely enought to give new importance to the DSP for anyplayer...
The last anyplayer on CT60 does no more use the DSP for MPEG because the HOST transfers are too slow...
The DSP in only use for MP3.

Thanks Dan. I checked the Supply and there is no fuse. I will check the 520. It is a US model. I had it open the day before and put in TOS 1.0 and did not see a fuse but I will check.

It is weird as the ST hs getting no power so I suspect the Supply being bad. I might have a lead to a working one that does not exceed the price of the Computer! LOL

Thanks
Tim

The MegaST has an internal DC/DC converter for the RS232 voltages, the 520ST
doesn't (if memory serves me right), so it probably needs the -12V.

>And now Atari is reborn. The new Atari is what, at heart, the original
>Atari was: a video game company.

The one thing everyone in this thread seems to keep missing is that Atari was founded as a coin-op company. I've never read anything saying Nolan Bushnell ever had any idea of getting into the barely existent home video game market when he founded Atari. IIRC (and I may not), it was one of his employees that came forward with the idea to create a home Pong console. Atari had to have backing by Sears to do that. Then they needed the capital of Warner Communications to get the 2600 out the door.

So which Atari do you mourn for?

a) Atari, Inc., founded as a coin-op manufacturer, but later getting involved in pinball machines and dedicated home consoles.

b) Atari, Inc., a subsidiary of Warner Communications, which took the Atari 2600 unprecedented heights and brought us the Atari home computer line while continuing to create top-notch coin-ops.

c) Atari Corp., bought by Jack Tramiel and intended to be mainly a computer company, but grudgingly made home consoles because that's where they money was.

d) Atari Games, which continued creating innovative coin-ops while owned primarily by Warner, Namco, Warner, Time-Warner (became part of Time-Warner Interactive), WMS, and finally Midway. Midway eventually renamed it Midway Games West before exiting the coin-op business.

e) Atari, a label of Hasbro Interactive. (Rescued from JTS after JTS and Atari Corp.'s "reverse merger.")

On r.g.v.c, the predominant opionion seems to be b. It may be c on the comp.sys.atari.* newsgroups.

Hi all

Updated my DX7 page with some new stuff.

1.The ULTIMATE DX-HEAVEN LIBRARY
2. New version of DX Convert. Used to create the above.
3.Screen shots and more info on SynLib
4.A section on Tims Sounds, including some new banks.
5.Organized it a bit more.

http://tamw.atari-users.net/dx7.htm

Have fun
Comments welcome.

Simple. Because this new "ATARI" is a software company, not a hardware
company. THAT is the difference I'm trying to point out to you.

> I'm sorry, am I supposed to feel bad about that, if true? Has Curt Vendel
> become the end-all be-all of Atari? If so, I didn't get the memo. I
> respect him for all he's done, but his opinion is still just one man's

> around unless you know what his opinion is.

I'm just saying that he seems to respect the legacy of ATARI, and that
included a lot more than just games. The consoles themselves and even
the computers are not unnecessary parts of the company that can easily
be overlooked, but that's just what you're choosing to do.

> You're really going to have to explain this point of view sometime. Atari
> is and was a video game company. What makes you think it was something
> more?

I think I've sufficiently explained above, but at the most basic level,
it's that ATARI wasn't just a software company like Infogrames is/was.
Pardon me for confusing you, but to me, a video game is software.

> Again, I don't see how your analogy works. Ed isn't *only* remembered for

> I'd have a "problem" with most of his fans! I may disagree and I may try to
> educate, but I realize that Ed's fans (like Atari's) all come at it from
> their own angle.

Well, you obviously don't really care much about the man's legacy. In
other words, it's like saying that George Washington was that dude who
chopped down the cherry tree, Abraham Lincoln was an avid theatre-goer,
and that Bill Clinton was just Monica Lewinsky's boyfriend. For a
software-only company to assume the mantle of ATARI is an insult to all
the great hardware that bore the name, whether it was developed
in-house or not.

> Well, obviously. But the Atari of 1996 was too, and nobody acted like they
> weren't Atari.

And who was the ATARI of 1996? I don't recall there being a company
with that name then, only that Hasbro stuck the name on their "classic"
releases. I don't have a problem with that, because Hasbro didn't try
to change their name to ATARI.

> Why poor Sega? Do you realize the company is profitable for the first time
> in years? It *is* too bad they had to get out of hardware, but that's just
> the way it goes. At least now, Sega will continue to make games, which is
> what they are really all about. Remember, Sega made games for the 2600 and
> other systems before they got into consoles.

Wow, I learn more about you with every post. If the 2600 and those
other systems weren't consoles, what the fuck were they???

> What you don't seem to get is that companies change. Sometimes they have
> to. Atari went through a strange period before rising from the ashes. Sega
> had a bit of a harder road, in some ways. It had to go through it's painful
> transition under the glaring spotlight of an industry it once dominated.
> Atari did it in the dim shadow of obscurity.

To my knowledge, SEGA is still SEGA. ATARI all but died, yet
Infogrames is now pretending to *be* ATARI simply because they own the
trademark. I'm sure they're counting on no-one having any idea that
they aren't the company that produced the 2600. It's like someone
putting out a line of PCs under the AMIGA name. Sure, Gateway owns the
name (or at least they did at one point), but it wouldn't really be an
AMIGA.

> Anyway, I really am tiring of this. Unless you've got something substantial
> and new to add, I'm off.

Done with our trolling, are we? Well, I'm sure you won't consider my
clarifications above to be substantial, so feel free to be on your way.

Okay, so when is the next "ATARI" coin-op coming out?

> e) Atari, a label of Hasbro Interactive.

Exactly. A *label* of Hasbro Interactive, which was itself a division
of Hasbro. Up until now, ATARI has been a *label* of Infogrames. Now
they want to name the *company* "ATARI". THAT is my definition of
hype.

Sega is still Sega, but do I really care? Not much. I liked their games, but I liked their platforms more.

Like it or not, "Atari" is whoever owns the rights to the name and trademarks and all. It's no longer a "pick up where the other's left off" game, like it was with the Tramiel's. It's a "we want the namesake and to build it back to popularity" game. But... Infogrames, having changed their name TO Atari is now *fully and entirely responsible* to all that name has ever meant, as well, what little it means today. This is why I think that they have put themselves in a much more potential position than ever before. I am reasonably certain, with a little bit of prep-work and planning, and team work, we might well be able to "coerce" Atari, Inc. into selling computers again... but, if nothing else, writing software for their new computers would be a natural move, since they already do software, games, and such.

We do all the prototype work FOR them and then present it TO them, with a suitable business plan and strategy. It's money we'd have to spend to get it done, but if they said yes... wouldn't the end result actually be worth it? It would be for me.

A wee bit behind the "Amiga Times", are we? "Amiga" (and all it represented) was sold to some people, who now call themselves "Amiga, Inc.". The AmigaOne (the new PowerPC-based motherboard/system) is available, but AmigaOS 4 (based on the AmigaOS 3.x sourcecode, but rewritten for PowerPC) is still being worked on. Amiga, Inc. is having some rough times financially, but the AmigaOne and AmigaOS 4 were farmed out to 3rd party companies, so that, if anything happens to Amiga, Inc. (many predict doom, as Amiga's legacy seems to be nothing but, since the day Commodore went belly-up), it won't affect the AOne and AmigaOS4 directly. This is, quite simply, the smartest move by ANYONE who has taken on the Amiga mantle since Commodore's demise. I applaud them for looking ahead (prepare for the worst, but hope for the best) and thinking of the user's for once.

Go to: www.amiga.com (main company), www.amiga.org (enthusiast site), or some other sites for the latest...

Folks, since I didn't seen any reasonable feedback (except one e-mail, no real offer anyway) I guess I'll put my fully loaded Falcon in closet until I'll need cash urgently.

Until then, enjoy your wonderful self, and please, carry on your successful mission to insult all the newcomers. This way you will keep your little society totally superior.

BTW: I sublitted a piece of code to Allegro gamedev library six years ago. Open source. No strings attached. And what about you, loud mouths? :)

Reasonably certain???? HAHAHAHAHAHA. What computer is this then? even long established computer manufacturers have gone tits up, or had to merge with other large companies just to stay alive. Compaq and HP anyone? Where the hell is some 2-bit software house like infrogrammes gonna get the money or backing to even re-sell a re-badged PC?

I think its time you took the pink sunglasses off.

Not sure if... if ever. If "Atari, Inc." owns (or somehow reaquired) the arcade rights to the Atari Games division, then I think it might be possible. What if we designed a new arcade system and had "Atari, Inc." write the games for it? Hmm...

> > e) Atari, a label of Hasbro Interactive.
>
> Exactly. A *label* of Hasbro Interactive, which was itself a division
> of Hasbro. Up until now, ATARI has been a *label* of Infogrames. Now
> they want to name the *company* "ATARI". THAT is my definition of
> hype.

The Atari *label* within the company ("Infogrames sells 'Atari' games"), has now been taken on as the *banner* that the company now trumpets under ("Atari, Inc. sells games"). Unfortunately, the box for Enter the Matrix doesn't reflect this namechange, but I imagine the next ones will.

It does bring some sense of satisfaction that Infogrames saw fit to restore Atari as a business (never would've expected such a drastic change as this, but...), even if that business is just writing games for PC's and home consoles.

They are now going to be responsible for what they do and how they do it. "Atari" is no longer just a trinket in their pocket (or anyone elses) to try and make some money. THEY are now the trinket and, in so transforming INTO the trinket... make the trinket into a substantial PRIZE!

Think about it... it they sell out... the next owner are merging with/buying Atari, Inc.! It holds more weight and water than if Infogrames just tosses a buying company the "Atari assets". Or, if Infogrames were to go belly up, the Atari assets might well be the only thing the buyers want, leaving Infogrames to rot in their misfortune, while the new looters take the only "name" really worth much... And the cycle of doom and gloom goes on. I think Infogrames wants/wanted to break the cycle of "whoring off the bitch" as just a singular "asset" within a company. "Atari" means less to EVERYONE when it's just a name passed around like so much unwanted pocket change. They've now increased the value of "Atari" substancially. "You wanna buy "Atari"? You gotta buy EVERYTHING!" And that's gonna be a whole lotta hundred millions now!

No one can predict what may happen in the future, but this may be a subtle (but drastic) manuver to insure Atari's survival as a company! As Amiga, Inc. has insured the safety of the assets of the "Amiga", by farming out the techologies to 3rd party companies, so Infogrames saw fit to *become* Atari, Inc. to insure that, should anything happen, Atari would be not only worth more, since it's now an entire, vast company, but also MIGHT be put back into the hardware business someday!

Infogrames may have actually had the desire TO make Atari a hardware company again, but have not the finances nor facilities to do so. Thus, they change their name (and all underlying branches, subsidiaries, etc.) TO Atari, Inc. and, in so doing, make the name well known again (in time; the name *has* languished and whithered a good long while) and, should finances permit or a buyout be emminant, the likelihood of making Atari, Inc. into a hardware company again might well be far more possible! Were I in Infogrames position (with the money and ownership of the Atari rights, I'd do the same thing, in the hopes of achieving a higher goal than just selling more software titles). Stick "Atari" far enough out into the sunlight, and EVERYONE is gonna see it eventually. Fathers will tell of the good old days. And children will play/use the older things of by-gone days. And, possibly... just possibly... what is old will be new again!

Let's hope that Infogrames is doing the "namechange thing" for more noble reasons than just to milk the namesake into their coffers.

The namechange we've witnessed could well be but the first big step towards a new beginning of Atari, since the end of the "Tramiel Squander Age"! It's something to hope for, isn't it?

Exactly. Such is the case with ATARI in a lot of people's minds,
myself included.

> Like it or not, "Atari" is whoever owns the rights to the name and
> trademarks and all. It's no longer a "pick up where the other's left off"
> game, like it was with the Tramiel's.

Well, the thing is, the Tramiels bought the company, moved in, fired
80% of the workforce, and kept going. However, ATARI was nothing more
than a brand name for years, so while Infogrames has every right to the
name, I'm just saying that it's pretty hollow.

> This is why I think that
> they have put themselves in a much more potential position than ever

> and such.

Wow, you are beyond delusional. I wonder if this is the reaction
Infogrames was counting on, or even expected. Right now, the Mac and
the PC are the only two personal computer platforms, and I don't see
that changing. As much shit as Mac users get for not using Windows, I
really don't think the market would support a third platform. Hell,
even Linux is just an OS that runs on existing hardware, not a whole
new platform. Forget about the days when there were five different
computer platforms, those days are over. Besides, all we ever wished
for back then was to be able to run each other's software on our
different machines, anyway. Now that Windows dominates the
marketplace, compatibility is now a non-issue. We got our wish, but I
dare say we didn't exactly get the best possible outcome.

> A wee bit behind the "Amiga Times", are we?

Yeah, well, after a brief flirtation with PCs (more like a torture session), I switched to Macs after my A1200 wouldn't cut it anymore (basically I discovered MAME, and 28MHz wasn't even fast enough to run older games under the Amiga version). I do remember hearing about AmigaOne, etc., but never seriously considered keeping up with these new Amigas. From what I saw before everyone around here stopped carrying Amiga magazines, every complaint PC users had about the price of Macs vs. what you get was actually true of the new Amiga machines.

I'll check out the site and see what they're up to.

Dude, you really need to wake up. Even if Infogrames does decide to
sell the ATARI properties (and they WILL if they are hurting enough
financially), I'm pretty sure they'd change their name again and keep
on going rather than allowing the entire company to be bought out.

Look at how much skepticism Microsoft's attempt to enter the console
wars was met with -- and that was MICROSOFT! However, the Xbox has
proven successful enough that it might be possible for ATARI to
introduce another console. My opinion is that they don't have anywhere
near the resources to do that, and if there is ever another ATARI
console, it will most likely be a "licensed" product like the LYNX
rather than an in-house thing like the 2600. You never know, maybe
when Bill Gates tires of the Xbox, he might sell the rights to ATARI.
It already kinda looks like an ATARI product, doesn't it?

4157. Atari Portfolio

I recently acquired an Atari Portfolio. It goes but it is in a little less than pristine condition. In particular, it lacks covers for the port and the bttery. If anyone has either of these, or portolio software or cards, I would be willing to negotiate a price.

I am in New Zealand btw.

Never. (Or whenever Midway either decides to start using the Atari
name in arcades again or sells those assets to someone else who does.)
What's your point? Mine was that many here are bemoaning the loss
of Atari consoles and computers, but that's not what Atari was
originally founded for.

And if Atari as a (PC) software company bothers you, I have four
words for you: AtariSoft and Atari Interactive. The former was
Atari's mid-80s effort to primarily cash in on the home computer
market. The latter was Atari Corp.'s last gasp before the
reverse-merger with JTS.

I've just updated 5 of my Atari Catalogs covering Games/Software, Books/
References and Hardware/Accessories for Classic Atari 8 Bit and Atari ST
Computer Lines! I've sold some and added some like DooM for the Jaguar!
http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari
Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods!
So not only do I sell NEW Atari Goods at a competitive price, I also sell
used Atari Goods you may not be able to find anymore at Swap Meets, Thrift
Stores or even Auctions Sites! And I sell for less! And unlike those who
will remain anonymous! I test Goods before I sell them. I can afford to
sell for less because I keep overhead down, avoid making promises I cant
keep and avoid offering services I cant follow up on! So not only can I
sell you some Great New stuff! But I can sell you hard to find 2nd Hand
Goods, partly because I'm the guy most people come to when they want to
give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion!
Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org
Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a
lot, I'm just trying to make a living and I'd like to earn your Business!
http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your
order goes out the same day. Customers love the speedy service! I have
lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or

4162. OGG replay on 68000?

Newsgroup: comp.sys.atari.st
Date: 2003-06-27 10:42:22 UTC
From: George Nakos <ggn@atarirocks.org>
Message-ID: <oprre9cwtq0mms9a@news.ntua.gr>
Source record: 26043
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

I have been pondering on the matter of poritng the Ogg Vorbis replaying routine to 68000. I have downloaded all the sources from xiph.org, including a player which uses integers only, but I have some problems.

Mainly, the integer only routine is 64-bit only and I can't modify anything since my C knowledge is quite bad. On the other hand, I have quite some skill in 68000 assembly.

Now, a weird thought crept into my mind one night. Why not compiling the Ogg sources on a standard Atari Compiler, and then reverse engineer the executable to see what happens? I'm not talking about real-time performance here, just loading and unpacking the file into memory. But my absymal C knowledge (see above) restricts me from doing that.

Hence this post. Is anybody out there willing to assist me? All that he needs to do (which is indeed a Herculian task for me) is to modify the sources a bit so that they will do what I described above (just load/unpack file), and then send me the executable (the modified sources would be nice too), so I can reverse engineer it and code it a bit better (if possible).

Any help would be appreciated. (please note that the minimum target machine is a standard 4mb ste - it will be of course upwards compatible).

Aniplayer at http://aniplay.atari.org/ will decode (and encode) Ogg files
on a 68020. Maybe you could go on from there.

From the Aniplayer package:

Ogg Vorbis 'Tremor' integer playback codec library, version 1.0.0.
http://www.xiph.org/

Here's a shared library of libvorbis-1.0rc2. It has been compiled with
Gcc 2.95.2 with -m68020-60 and works only under MiNT 1.15.3 or more and
MagiC 6. TOS cannot load .SLB, but an SLB loader exist with MetaDOS:
ftp://ftp.uni-muenster.de/pub/atari/Utilities/slbld028.lzh
http://www.muenster.de/~reschke/soft_e.html

Requirements:
- 68020 or higher
- MiNT 1.15.3 or MagiC 6 or MetaDOS 2.74.

You're asking for an awful lot. I hope you don't expect real-time
decoding and playing without specialized hardware as a typical 68000
processor isn't enough. Even a 68030 just isn't fast enough hence the
Falcon must use DSP support. But actually AFAIK there is no OGG vorbis
DSP support yet in Aniplayer so mp3 is the way to go for real time
playback on the Falcon. The 68060 however I suspect will not even burp at
playing back an MP3/vorbis file.

If you simply just want to decode and don't care how long it takes,
Kenneth's suggestion of Aniplayer is the way to go and I'm sure the vorbis
stuff could be compiled for 68000.

Can I ask you a question?

If so many deride you for advertising on this newsgroup and call you gay and such, why do you advertise here?

Are you recieving sufficient orders for stuff to warrant the "personal war" against you that goes on? If so, then, great. But if not, seems a bit of a waste of time and energy.

Just a thought.

By the way... if you have an empty 1040ST case (with power supply and keyboard only), let me know what you want for it, plus shipping to 85635. I'm looking to create an interesting project later on down the road.

Do you think Ben should back down from the cowards?
Most folks see the harassers for what they are.

Ben provides a service to those who use the Atari Computers of which sources
for hardware and software are getting pretty scarce these days.

Rudolfe,
Aaaahhhhhh, that is bad news. So if we are to have
a new DSP it seems the 56300 series is the only way to
go??? Well, I believe this is the future of our
platform. Which is to maintain this multi-processor
computer that can have apps that use both processor
and DSP at the same time.

Thanks,
Carey Christenson

4175. Apple serial port on Atari TT

Newsgroup: comp.sys.atari.st
Date: 2003-06-28 01:54:20 UTC
From: Bill Clinton <Nospam@aol.com>
Message-ID: <3efcf554$0$23098$5a62ac22@freenews.iinet.net.au>
Source record: 25957

the apple serial port on the TT allows connection of Apple compatible printers, such as the HP LaserJet 6Mp.

I have it all here and the plugs fit, just wondering if there are any drivers or such to get graphics printing ability.

I'm quite certain i could print to serial port #4 (apple port) but this would be text only i'm sure.

anyone done this before?

OK,
First the DSP has no sense with a G4 because of the Altivec !
Second, the TI DSP are so better than the old 56300 !!

SO, I don't think I will one day use a 56300....

Message-ID: <3efd8c18$0$192$4c56ba96@master.news.zetnet.net>
Source record: 25960

Hi All!

Can someone help me with Cab 2.7c?

Many sites these days use cookies. I have got them enabled in Cab,
currently using the "Always Accept" selection.

However many sites complain that cookies aren't being accepted. I know
that these do work on some sites though!

Why?

Is there nothing else I can do?

I am using Sting v1.26 for TCP/IP and Dan Ackerman's CAB OVL v1.4401,
under MagiC v6.01 on my Falcon030.

Cheers,

James

4184. Gemdos error...

Newsgroup: comp.sys.atari.st
Date: 2003-06-28 13:58:26 UTC
From: Raoul Teulings <rt@xs4all.nl>
Message-ID: <1056812760-625446AEicMi@xs4all.nl>
Source record: 25966

Can somebody help me with a recurring problem: i
still get Gemdos errors memory and sometimes
stack overflow messages when i go to the menubar.
Is it something between the Novadriver and
Jinnee? It happens the most frequent times
working in Papyrus when i try to save or load. I
cancelled the working of Boxkite, threw Stewart
out of my system but still it's happening. It is
kinda frightening because if i do not save very
regularly large portions of new written texts are
lost....

Thanks,

Raoul Teulings

Could it be your power supply is dead??? I would look at the ST's
motherboard and see if everything is ok.

No, I'm sorry, you're wrong. "Spelt" is a type of grain (like wheat, rice, etc.). "Spelled" is a word.

I try to be nice. You like to be mean. But, in the end... I will catch and squash you, like the tiny insect you are, on EVERY MISTAKE YOU MAKE!

So, who's the smarter one, hmm?

Oh, and you want another nugget of wisdom? Type in "Vitamin B17", "Wheatgrass", or "Apricot kernel" into Google and learn that there is a natural *CURE* to many types of cancer that the FDA and outside world don't want you to know about, because they can't make any money from it.

Off-topic, I know, but... just like I helping people wake up (just as I did a few days ago) to the knowledge that the "governed world" is NOT our friend, but the plants in it, ARE!

Luposian

>>but clicking on the play arrow did nothing at all! Any ideas? his
>>is on a Falcon and MagiC 6.01, witth VORBIS.SLB and VORB_ENC.SLB in
>>the MAGIC\XTENSION folder.
>
>FPU?

Yes, MC68882 fitted.

>Ogg works fine here on a TT, both encoding and decoding. But slow...
>Magic 6.20

My MagiC 6.20 is not yet installed as I am having some problems
with printing - IdeaList for instance won't print with my present
setup. I'll have to try disabling some of the other running
apps/accs ... when I get time. At present I'm still using 6.01.
Oh, and my Aniplayer is not registered (yet). Should that make a
difference? Alternatively, perhaps it's slow reading off the CD?
I'll attempt transferring the file to a hard or RAM disk and try
again.

Regards, /Peter/

I recently tried to play an Ogg file from the last ST Computer CD in
Aniplayer, but it could not be started - the dialogbox came up OK
but clicking on the play arrow did nothing at all! Any ideas? his
is on a Falcon and MagiC 6.01, witth VORBIS.SLB and VORB_ENC.SLB in
the MAGIC\XTENSION folder.

You should write to Didier Mequignon on fr.comp.sys.atari to get help
for OGG.

I play OGG under TOS in rom with slb loader of spin in my AUTO folder and the
previous Vorbis slb in the auto folder too. Beware, I think that the latest
vorbis slb were compiled for 68060 only.

Anyway a 68060 seems minimal to do the job, maybe that a 68030+68882 can do it
too but Didier clearly wrote that a math coprocessor is necessary.
So I'm sorry but a 16/32 bits at 8 Mhz is definately not enough.

Regards

Registering should make no difference. The only difference I got when
registering was no delay on start.

I have converted Ogg files direct from CD at 4* (Extendos) and it works
fine. Note that converting is not a realtime process so you made a really
long shot...

I would check up carefully that all Aniplayer files are from the same
version and that you are using the right SLB for your hardware.

I like to think of myself as someone who knows all about setting up
STinG, but sat here and could not get it going. Turned out to be one file
that I had forgot to exchange...

Btw I'm right now converting a long 30 frames/sec 352*232 divX film to
RLE MOV at quality 1 and a keyframe of 8. Some test show that this
produces an almost viewable film with sound. Lots of frames gets skipped
but this has the advantage that you see the errors that quality 1 produces

A tip is to turn off "Direct display" and keep "Good Quality" on. I'm
doing this in 256 colours and then when viewing the film the switches
goes the other way round. This makes the film rasterized so "Good
Quality" makes no difference.

I do miss two things in Aniplayer:

A possibility to reduce "frames/sec" and to reduce picture size by half.
Would be very usefull when trying to make a film viewable on a slow TT...

The Aniplayer SLB's are C compilations. This guy is an assembler coder
who (if he likes a lot of work and has the skill) might be able to write
faster code.

>So I'm sorry but a 16/32 bits at 8 Mhz is definately not enough.

That's only true for the C SLB's. In assembler you could let the 68000 do
the job instead. It will be very slow but possible.

This is message from MiNT kernel, not from Thing.

You can quite safely ignore it.

From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3efdfd38.0@entanet>
Source record: 25975

A while ago I installed a 20Gb hard disk in my Milan alongside the 2Gb.

I had problems using it as a boot drive so I ordered the latest version of HD Driver and I now have Vn 8.11

I have partitioned it as follows:

H : BGM : 381.9
I : BGM : 954.6
J : BGM : 954.6
K : BGM : 1909.3
L : F32 : 5537
M : F32 : 5537
N : LNX : 3818.6

Using Mint/NAES/Thing I can access the partitions ok but if I open a window on I, J or K, select all and do Ctrl-I for Info then I get an error from Thing saying "block_IO.c abort, no free unit in cache! (cache to small?)"

I started with 2Gb partitions but I keep making them smaller but keep getting the error message. I suspect that the error will only disappear when I get to 500Mb (the same as D and E)

I don't think it is a HD Driver error, is this a known bug in Thing ?

Regards,

Peter

4198. The Nordic ATARI Show

Newsgroup: comp.sys.atari.st
Date: 2003-06-28 23:18:12 UTC
From: Mille Babic <mille@REMOVE.telenordia.se>
Message-ID: <1056845956-62670AEicMi@REMOVE.telenordia.se>
Source record: 25980

The Swedish ATARI Users Association (SAK)
The Nordic Atari Computer Show (NAS) 2003

Dear Atari friends, now it is only a week to NAS03.

It's once again time for the Nordic Atari Show, the annual get together
which has rapidly become a fixture for all Atari users.

We arrange the show for the eight straight year we hope to fulfill
everyone's expectations and that this will result in the best possible
atmosphere.

INFORMATION ABOUT NAS 2003

Where?
Bï¿½ltgatan 2-10 (Corner Stampgatan 15).
Gothenburg, Sweden. A part of a school called
Nya (New) Samskolan.

When?
5th - 6th of July 2003

Opens Saturday July 5 1000 and closes
Sunday July 6 at 1600.

How?
10-15 walking minutes from the main Railroad station.
Just follow the tram on direction New Ullevi. The tram
station at NAS is called Stampgatan.

What?
The main thema is Networking and ct60. We have at least six ct60
at NAS. ATARI original och compatible computers,
like Hades060 and Milan. A ethernet based network with a Internet
connectivity is available to use with own computers, at this
school called "samskolan".

Entrace:
40 SEK, visitors outside Sweden free entarce.

Info:
Information available at our homepage http://www.sak.nu/

Accomodation:
You can spend the night at NAS, just bring something to make the
floor comfortable. For youth hostels and hotels http://www.sak.nu/nas/hotels.htm

E-mail:
info@sak.nu (Svenska Atariklubben),
mille@ebox.tninet.se (Mille Babic)
mrfuture@home.se (Andreas Sjï¿½ï¿½)

Take part:
For enthusiasts that cannot visit us have some possibilities to
interact with folx at NAS through a webcam, photos and videos.
http://212.214.15.116/~mille/nas.html
A IRC-channel is open at IRCnet, called #atarisak

Our members and other enthusiasts of the ATARI platform will bring their
ATARI Portfolio, STacy, STF, STE, Falcon030 & MkX and TT030.
ATARI Jaguar64 connected with each other, games and demo. Most 16/32-bit
computers are enhanced with CenTurbo 2 and 60, eXtender, Nemesis and
memory upgrades. Solutions for ethernet, CD-Burn, D2D, Backup, storage
and other periph is to be seen.

Network solutions is common, most with LAN Pocket Adaptors and
Ethernec ROM-port-adaptor and serial connections aswell with either STinG,
MagiCNet or MiNTnet.

We know that at least seven users will bring their ct60 to NAS and we hope
that the other swe users will do the same. At NAS they can configure, enhance
and share knowledge.

4210. Marpet and Power Computing Memory Upgrades?

Newsgroup: comp.sys.atari.st
Date: 2003-06-29 12:52:10 UTC
From: Thomas Wellicome <tjw@zetnet.co.uk>
Message-ID: <3efee126$0$198$4c56ba96@master.news.zetnet.net>
Source record: 25992

Hi all,

Can anyone out there supply me with a copy of the installation manuals for the Marpet Xtra Ram upgrade and the Power Computing 4mb upgrades for the ST. Or point me to a website with details of how to install them. I did it on a ST years ago but the chips are different in the two machines I now want to upgrade (I think the soldering irons going to have to come out). Thanks for any help...

Thomas

It's nice to see that the people that seem to hate you, are so ineffective at doing do. If you can pick a few pearls (sales) out of an otherwise stinky trashcan of garbage (flames and hate replies from anonymous cowards and other "believers of the lies"), why not endure the stench to do so, I figure. :-)

BTW, assuming you've been reading any of my posts, if Atari, Inc. decided to start selling computers again, would you be interested in selling them? In other words, are you just trying to get rid of current inventory and get out of the Atari business or would you continue to "sell Atari" if more, new stuff arrived? Just curious.

Negative attention. Positive attention can be attained by posting a link to
your ads. That keeps everybody happy, it minimizes the amount of spam in
this group to those who are not interested and yet makes it easy for people
to find you should they need something. Which part of this don't you
understand?

All you are doing is dividing your potential customer base. Not a very smart
move from a "businessperson" attempting to make some money from a niche
market.

It's not so much what I don't understand about Ben... it's what I don't understand about why there are people using SLANDER to drive him off. They claim Ben is gay... akin to some huge, 800lb. male gorilla-humping homosexual, when it is more than 100% likely that they are simply clueless about him personally and doing ANYTHING they can to drive him off, because they are tired of his repeated advertizing posts.

I think the device is known as a "kill file" (not sure how you use one or what they are exactly), but the offended people should just use them, so the messages he posts simply don't appear on their end.

Think of this (or any other newsgroup) as a TV. You advertise X number of times on TV to try and get your product into the eyes and minds of potential customers. Advertising here is free, so in encourages him to post more often.

Can you image what Atari's business success rate might have been like if they had been able to advertise as cheaply as they could today, across the Internet?

Do we rant and rave everytime we see a Procter & Gamble commerical selling Crest or whatever and say "Yeah, those guys at P&G are all a bunch of 800lb HOMOSEXUAL FAGGOTS, THAT HUMP GORILLAS ALL DAY LONG!" No. We either IGNORE the commerical, tune the volumn down./off, change channels, or, at the very least, walk out of the room!

Personally, I have little to no interest in what Brovao (wha... huh? What typo monster typed THAT? I mean Bravo) Sierra is pitching to sell. Why? I'm out of the Atari arena. Atari doesn't sell hardware anymore, so I'm not buying anything Atari anymore. The only reason I want an Atari 1040ST case is for my own strange ideas of possibly creating a pseudo-prototype of some whacky Atari PC I want to see happen.. Nothing more. Nothing less.

But I kinda like seeing someone... ANYONE... selling (or trying to sell) Atari stuff. It shows that there is still someone in the vast desert known as Ataridom, trying to keep the spirit alive... or at least get rid of what they've got so they can close their doors forever! :-)

> All you are doing is dividing your potential customer base. Not a very smart
> move from a "businessperson" attempting to make some money from a niche
> market.

At least he has product to sell. Look at me... I get attacked because I'm pitching nothing but a DREAM! An IDEA! I've got Steve Sweet going after me like I'm some sheep he wants to rope and make happy! At least Ben's trying to sell something tangible!

'Tis easy enough to ignore or avoid him, if ye like. Why waste effort and energy attacking him?

But it stops lots of processes from working properly. For instance, if I
do a search of one of these partitions with Suji it displays lots of these
dialogs and some corrupted ones as well.

It creates problems when copying files as well.

Suji isn't that a search program primairly designed for Magic as
replacement for MGSEARCH? I never have used it myself mainly because it
required Wdialog (latest version can work without I believe), but I can
imagine it can give some troubles when used with MiNT/N_AES.
For search I use Parafin or find

CU,
Martin

The reason why people like myself, and Steve S dont like your shit is I
guess is because weve had this "I had a dream" crap for like nearly the past
10 years. All you do is succeed in opening old wounds in people who have
seen thier beloved Atari platform flatline on the operating table, and
everybody has come along and stripped out the organs and just raped it of
what little was left, and then f**ked off to look for another target.
Infrogrammes is just the next in a long line...

4226. Boot problems with MagiC / & more

Newsgroup: comp.sys.atari.st
Date: 2003-06-29 23:39:06 UTC
From: THOMAS RICHARD JORDAN <tom-jor@tiscali.co.uk>
Message-ID: <3eff6c42_1@mk-nntp-2.news.uk.tiscali.com>
Source record: 25908

Just recently I have experienced a directory crash on the root drive.

At the moment having severe problems in getting a reliable MagiC set-up up & running.

With MagXboot set up to run as the 1st auto prg, computer fails to boot into MagiC instead goes to the TOS desktop. I have to use the Maxbo32.prg found in the extra folder of MagiC.

This is useable until the Mag.inf is replaced with an alternative Mag.inf which loads up Jinnee. At this point the computer is most likely to crash, 2 or more bombs.

Reverting back to the previous inf file does not always enable MagiC to work.

Over the last week have lost count of the times MagiC, NVDI or Jinnee has been reinstalled.

For example got a working NVDI system yesterday. " Xboot, Extendos, NVDI ". Yet when I came back to try again tonight 2 bombs are displayed. There has not been any change to NVDI. Although MagiC has been reinstalled at least twice. I know that this should not have effected NVDI.

Maybe its time to start from scratch & repartition the drive ? or buy an alternative drive ?

Any help would be welcome

regards

Thomas

Actually, that's not true. The Atari 3-in-1 from last year (Centipede, Millipede, Missile Command) was an officialy released Atari coin-op released through cooperation between Midway and Infogrames, and manufactured through Team Play, Inc. The original deal was for a coordinated US (Midway, Team Play) and European release (through Infogrames' coin-op subsidiary). However it was released here before the deal went through - consequently the Atari name (which Ingrames fully ownes) didn't go directly on the coin-op. Instead Team Play put the Infogrames name to cover all bases. On a side note - the Atari copyright in the roms were replaced with a Midway copyright when the roms were delivered. Hence they were to change them back to an Atari copyright, but instead did Infogrames because of the same previously mentioned problem.

This is a public newsgroup. Not some private clique! As long as he follows newsgroup protocol and any rules therein, he has just as much right to be here as any of us. Do as I do (though I'm sure you'll avoid that as much as possible, for personal reasons)... ignore what you don't need or want and read what you do, if present.

I "read" very few posts here. Mostly ones relating to threads I've posted in and expect replies in. I know how to randomly search and find what material I'm looking for. I don't "batch read" (nor am I forced to) every single message and reply. That's stupid!

You, of all Atari newsgroup denizens, should know that, if a low-life, scum-sucking, pork bladder, lice-infested nobody like me (dang... I'm soooo

good at self-depreciative comments! I should demand money for doing this!)
can do it, surely you can, too.

Or are you admitting that you're lower than I am on the evolutionary scale?
:-)

The only models that would "fit the bill", as the saying goes, would be the Atari TT030 and the Falcon030, which both have the ability to display 256 colors (640x480 resolution, I believe) on the desktop. The Falcon030, is able to display "true color" (32,000 colors if I recall correctly) at 320x200 resolution. The TT030, however, due to it's VME expansion capability, may be able to do better than this with a VME video card.

The Falcon030, however, has DSP capabilities (mainly for audio use), but only has a 16MHz 68030 vs. the TT030's 32MHz 68030. Other details exist which I am less definite on and will not comment. Both computers are still pricey (a few hundred dollars or so) and somewhat rare to come by.

What's your problem anyway? First of all, what's your remark that I don't know anything about the music business based on? And what did I ever do to you that makes you so angry after one single 2-line post from me? Did I miss something? Did I hit your mother or steal your girlfriend or what?

Hmm, reading your other posts, I see you have a habit of getting irrationally mad when someone doesn't agree with you. I can draw my own conclusions from that. Seeing that, me and others will know who is the real idiot. ;)

Maurits.

4235. [UPD] July Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2003-06-30 09:18:13 UTC
From: Francois LE COAT <lecoat@lutece.net>
Message-ID: <3F000055.8090402@lutece.net>
Source record: 25917

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka307.zip
That is the Complete Common Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny044.zip
Is the OpenGL Extension (requires previous package)

The main update in this release is the ability to build
demonstrations of the software in all its parts, using
the RECORD.ACC accessory. A new "3D.REC" demo file has
been added to show this new ability in 3D.
Be aware that this month, lib_dgem.zip and tiny044.zip
has also been updated.

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT

Sometimes Dan's OVL is better, sometimes it's Oliver's one. But some
sites send/check cookies with JavaScript and you cannot do anything in
this case with Cab. Even if JavaScript is not used, Dan's and Oliver's
OVLs do not always cope with cookies.

Bye,
/Pascal/

It might be worth noting the theory that some people who suffer from
Asperger's Syndrome or similar tend to get into computers and become real
experts because of there ability to focus hard on a specific subject.

They normally behave a bit strange in social terms but that is something
you have to live with and instead try to benefit from there often deep
knowledge on specific subjects.

I'm not saying Smeg suffers from Asperger's Syndrome, only that someone
who does might write in the same manner.

People with bad manners but deep knowledge about our subject should be
honoured. A combination of harsh behaviour and little knowledge is
another thing...

Use a directory sorting utility to ensure that XBoot is indeed the FIRST
program in the list. I think that version of the booter is the correct one
for a Falcon. IIRC it write-protects the area of RAM that holds the MagiC
kernel.

> This is useable until the Mag.inf is replaced with an alternative Mag.inf
> which loads up Jinnee. At this point the computer is most likely to crash,

I'd suggest using an exact duplicate, with only the Shell line changed to
point to jinnee for a test.

> Reverting back to the previous inf file does not always enable MagiC to
> work.

Then check for corruption in one or other inf files.

> Over the last week have lost count of the times MagiC, NVDI or Jinnee has
> been reinstalled.

Get a working system without XBoot first. You can use the batch file feature
of MagiC to load whatever progs you would normally use if you don't want to
move unwanted stuff out of the Auto folder.

> Maybe its time to start from scratch & repartition the drive ? or buy an
> alternative drive ?

I don't think that's necessary. It does sound that something is being
corrupted, at the moment I'd put XBoot to one side as I suggest.

The only way you're going to be able to sort this out is by disabling progs and accs one by one I'm afraid :-(

BTW is it only when you visit the menu bar that you get the problem, or do you still get crashes if you use the "Save as" keyboard shortcut? That might help you narrow the cause down, maybe.

Humm...
You need lot of power for ogg vorbis, more than mpeg audio layer 3.
I have compiled the vorbis integer library (with Gcc 2.95), I obtain 50%
of load under MagiCMac and a PPC G3 500 MHz.
I have compiled the normal vorbis library for the 68060 (with Gcc 2.95),
I obtain 80% of load under my Falcon/CT60 (68060 66 MHz).
I cannot rewrite the library for the DSP because Ogg Vorbis need lot of
memory.

I don't know if you can overclock the 68000 to 500 Mhz.

Regards,

Didier.

Hi Derryck,

Thanks for the help. Well, it has also to do with
the order of programs in the autofolder i
guess...Because sometimes a strange and very
little square field emerges on the screen and
causes the same gemdos error. AFAIK that has to
do with the Nova driver and i placed it on
another spot in the autofolder; maybe that
that'll help...

Has Trapper.prg to do with it? That's the last
proggie i installed.

>keyboard shortcut?

Most of the time it does, strangely not when i
use the normal (control-S) saveoption...I think
that Boxkite performs a great deal to this
problem but i am not sure. It is hard to get rid
of it 'cause it is very convenient compared to
the standard MagiC fileselector. I'll keep going
on with my 'try and error' quest...

Hee hee :)

That clears up a lot.. I'll keep this in mind while reading this newsgroup, and since half of the readers of this group enjoy flaming the other half (as they did when I left it several years ago) I'll need it.

I'll just ignore any comments like "you obviously don't know anything about.." and "you are an idiot" as long as they aren't accompanied by solid arguments. However, if anyone can provide those arguments, I'll certainly consider them seriously. :)

Maurits.

It's OUR newsgroup and as such it's perfectly acceptable for anyone to
express their opinion on the subject. This would be obvious unless you have
some retarded view on freedom of speech.

This is not however a trading forum and Benny's posts are completely OT, in
fact SPAM.

Regards,

Clockmeister.

Microsoft proved that it was technically very easy to build a console: put the latest PC hardware in a fat green box, build a proprietary SDK and you've got an Xbox! The rest is all about the cash and marketing.

It takes skills and inspiration to design beautiful and compact systems like the Sega Dreamcast or the Atari 800XL, but the success of consoles will always depend on the quality of the software for them, which is Infogrames's specialty.

I'd like to point out that Bruno Bonnell and Infogrames have been around for a long time and have a long list of quality classic games developped for french and british platforms like the Thomson, Sinclair, Oric and Amstrad (and later the Atari ST). Needless to say the Atari name is in better hands with Infogrammes than with Hasbro or even the Tramiels and that if they keep afloat with their finances, they might as well come up with some decent Atari hardware in the next few years.

4252. Bravo Sierra's website...

Newsgroup: comp.sys.atari.st
Date: 2003-06-30 18:16:15 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <s7%La.85354$Pc5.28868@fed1read01>
Source record: 25934

In going over to the website, itself, I am struck by just how unprofessional it really looks! Of my list of complaints:

1) Ben rages on about how horrible auctions are (I happen to use and like eBay).
2) Refers to himself as "a grumpy Benny Bear" on his contact page (quoted below)

>You never know when I'll be awake. If I'm asleep, I won't hear it. No worries about a grumpy Benny Bear answering.

3) Apparently, he has no secure credit card ordering option.
4) Page layout is poor, with run-on sentences, and such.

The list goes on. To me, the Bravo Sierra website (if you're gonna run a one-man show under a business name, don't let your buyers know that!) is, without a doubt, ENTIRELY unprofessional to let your buying public in on your personal sleeping habits, the way you live your life, and what kind of person you are, if you are awakened at a certain time.

Note, that *NONE* of what I am stating makes any reference to him being GAY or FAT. I am speaking only pure fact from what I've seen myself and feel others should know. Sure, one could somehow deduce, in a twisted way, that his mentioned sleeping habits and comment of calling himself "Benny Bear" (eeeew!) was *possibly* linked to being overweight and *possibly* a little "strange", but I don't think that really holds any water.

I think the guy just hasn't a clue about website design and is too "friendly" concerning his personal habits and life.

If you want to deride him for posting endless ads in a newgroup that isn't meant for it (is there an atari.forsale newsgroup? I don't recall), then fine. But, if he has nowhere else to advertise, what's he supposed to do? NOT advertise? He's got stuff to sell. Maybe it's filling up his closet space or getting shipped in from people who don't want their Atari stuff anymore. I dunno.

All I know is that, unless he is willing to deal with me via eBay, PayPal, or secure credit card transaction, the guy isn't gonna get my money or business, plain and simple. I'd like to give it to him, but I simply can't.

I think, the best thing for him to do right now is to seriously examine his website, have a web site designer examine it (or just buy a "do-it-yourself" web site design program, and fix it up in a hurry.

He's only hurting his own business leaving his website in the condition it's in and saying some of the stuff that he does.

Rules I like to live by:

1) Don't "tear down" (talk bad about) other business avenues (ways of doing business) or people.
2) Don't talk about yourself. You're selling product, not an expose' of your own life.
3) Offer several ways to get people's business. Use PayPal (or other secure service) to handle credit card orders.
4) Don't brag about how you do business. Facts and references speak louder than self-pride.
5) Present web pages and links that are straight-forward, simple, and to the point. A little "snazz" might help, too.

Agreed, the Atari arena isn't much to look at these days (few businesses still selling anything "Atari"), but if Bravo Sierra presented itself with a clean-cut, professional, image and none of the personal fluff that makes it look so unkempt, I think his ads posted here would hold a lot more weight, if/when people clicked on a link to his website.

Benjamin... do yourself a favor... take down your website, do some serious analysis of the content therein, and find a way to present it better. I can offer no better advice. As for your catalogs... keep 'em simple, clean, up-to-date, HTML.

Unfortunately, looks like my siding with "Benny" to the degree I have, has also brought out that yellow, pork bladder, known as "Anonymous" from under his moldy rock, calling *ME* a gay homosexual! I'd really love to show him my wedding ring and my wife of 5 years and our 4.5 yr. old son. That'd put a smelly sock in his mouth for good!

We wait for a delay of 15 days before continuing shipping cards.

This delay is used by developers to send bug reports...
And we received bug reports about HDD problems, boot problems & DIMM problems...

We are working hard to find solutions.

For boot and HDD, I think it will be ok tomorrow.
For DIMM, it is a bit more complex because some DIMM are working and some are not working...and we are not yet sure why ...

Let us time to finish the product and send you a free bug product..

Things like high colour desktop are always processor cycle munchers, if you just want a machine to have a colour then go buy a Nokia phone.

If you post back with some ideas of Applications you'd think you'd use, or hobbies you'd like to computerise then we could point you at some software, possibly free even, to do what you want to achieve.

&
> running.

What hard disk driver are you using, if it is HDdriver then switch of the magic features and reboot. Do you have your hard drive correctly terminated?.

I suggest that you boot into TOS,

Delete NVDI.fif in your fonts folder and reboot,

find some software that will run a diagnostic on your hard drive, correct any problems highlighted by this step,

reboot, play around under magxdsk until you confirm the system is stable,

Enable Jinnee via the shell line in magx.inf, test jinnee.

> With MagXboot set up to run as the 1st auto prg, computer fails to boot
into
> MagiC instead goes to the TOS desktop. I have to use the Maxbo32.prg

Xboot should be the first app running so that you get control early.

4261. Newbie question about Atari 520 ST

Newsgroup: comp.sys.atari.st
Date: 2003-06-30 20:38:17 UTC
From: mikhol@tiscali.se
Message-ID: <5d166f51.0306301238.263c05ee@posting.google.com>
Source record: 25943

Hi,

Yesterday I picked up a Atari 520ST at a flea-market for a couple of Euros (10)... I'm a total newbie to Atari, TOS, GEM and all this nice stuff... Is there any nice sites with info on how I use the thing? It came with a grand total of three games, and a wordprocessor. And I couldn't get the basic to start (disk error) so I probably need a good working version of the Atari ST Language disk?

I've been using my TV as monitor for the computer, but I would like to try out the high resolution mode, so I probably need a good monitor. Would any old RGB or RGBI monitor work? And if so where can I get a suitable cable?
I have a Commodore 1901 monitor with a RGBI input and Chroma/Luma input. Can i use this old thing with my 520?

Regards,
Mikael Holm

I was NOT attacking him. I was simply stating a few facts based on what I saw on his website. I figure, with all the FAT GAY FAG HOMO trash being thrown at him, I might as well throw in a bit of TRUTH! Seems everyone hates him anyways, so what actual harm is a little truth going to do?

I was simply trying to put some honest perspective on things from someone who *doesn't* already hate him for no good reason, other than forcing themselves to read his ads (which shows what stupid primates the complainers are) and then rant later on about it.

No, it's not my problem, but... I decided to report on what I found, based on a curious exploration of his website. A little honest criticism never hurt anyone... as long as it's offered from the perspective of helpful and not hateful.

Luposian

Notice my reply address? It's pointed to Lycos.com. NO ONE has my REAL Inbox address, except a very few specific online businesses I deal with and a close friend of mine (No, Steve... it's not you... as much as I know you'd like it to be). And I'm STILL getting a couple pieces of SPAM once in a while. RATS!

Glad I'm good for a few chuckles, Smeg.

"Luposian" is a fictional first name, based on the Italian word "Lupo" (Wolf). The "sian" portion was just added to finish it out and make it sound cool. I happen to have a great love of wolves (I suppose my tagline quote might be something along the lines of "Rope me a wolf and I'll make it smile."). So much so, that my fictional character (Luposian) and I are basically one and the same. He is, as I term it, my alter-persona. He is a bi-pedal canid species, known as Homosa Lupus ("Homosa" from HOMO SApiens and "Lupus" from Canis LUPUS; which is their scientific name. "Human Wolf" is their common name). Once human, but genetically transformed to lupine, by an unknown force. Having the same mentality and stature as a human, but possessing the wolf appearance (head, fur, hind paws, and tail), instinct, and supernatural abilities. Do I sound crazy enough to you, yet? Good!

I am, what some might to refer to as, a "fur". I enjoy reading/viewing "furotica" and furry art.

Here's an URL you can visit to get better insight to this facinating realm of interest:

http://www.yerf.com

Just remember... YOU asked! :-D

4273. Help with external CD for Falcon...

Newsgroup: comp.sys.atari.st
Date: 2003-07-01 03:52:00 UTC
From: JagCube@yahoo.com
Message-ID: <83fbea98.0306301952.46af0be2@posting.google.com>
Source record: 25805

Hi Guys... well, I finally got my cable in for my SCSI external CD rom drive.

Now.... is there anything specific I have to do to get the Falcon to recognise it?
It has AHDI 6.05 and see's the internal IDE drive (of course) and says SCSI unit 0 not responding, though it looks like it accesses the CD drive for a second...

I'm guessing I need some sort of driver maybe?
It's an external APS 4x2x6 CD-RW and well, I'm ready to go now all I need to figure out is how!? :)

Any and all help/advice is very much appreciated!!

Thanks,

Clint Thompson

Yes, you need a CD-ROM driver, e.g. SPIN! or Extendos pro.

It
> came with a grand total of three games, and a wordprocessor. And I
> couldn't get the basic to start (disk error) so I probably need a
good
> working version of the Atari ST Language disk?

Welcome to the world of Atari, its not unknown for old disks to go bad
and if its the original (Metacombo) Atari basic its not really all
that useful as there is no complier, therefore you to have basic
running (which consumes precious memory) in order to run any of the
basic programs you write. There are other basics around, most Atari
users that programme(d) in basic tended to use STOS, it does have a
compiler so that you can create stand alone programs and although
designed for writing games you can write applications with it.
There never really was a Language disk although there was an
"Explorer" disk that had a couple of useful programs on it one of
which was a self running visual tutorial that actually shows you how
to open folders, move and resize windows and stuff like that -
althouhg its not comprehencive its a reasonable place to start and I
could e-mail you a copy if you want.
If you do a web search for "Atari ST Manual" you will probably be able
to find web sites that contain scanned copies of the user manual,
alternatively I have been writing a program that is a sort of
interactive user manual that contains a representation of the Desktop
and its menus where selecting a icon or menu option displayes a text
file explaining that that item does and how to use it, its not quite
as I would like it yet but it is a a stage where it is useable, I can
e-mail you a copy if you want.

> I've been using my TV as monitor for the computer, but I would like

> input. Can i use this old thing with my 520?

Not sure about the Commodore monitor however as it is RGB that would tend to indicate that it is a colour monitor and although they can display mono images they are generally not suited to being used as mono monitors for two reasons.
First, I beleive I am correct in saying that the mono resolution requires a higher frequency than colour and so the monitor is just not capable of displaying it.
Second the monitor socket on the ST has a mono detect pin which is set by its connection to the monitor and the ST will only enter high resolution when it detects the correct input on this pin.
Your best bet if you do not want to purchase a mono monitor is to use a mono emulator such as "serbra" you can probably down load it from several archives and web site (look under emulators) try the UMICH archive at http://www.umich.edu/~archive/atari/ or the Ultimate TOS Software index, failing that try a web search for it, however you should not that in my opinion it does not look that great on a colour monitor and you probably should not try using it on a TV unless you have a fancy multi sync TV.
As for monitor cables/adaptors it depends on where you are but Keychange (www.keychange.co.uk) or Atari Workshop (www.atari-workshop.co.uk) will probably have what your looking for.

Tonight we (Chris Martin & I) managed to make further progress.

Ordered a Ajax drive controller chip from Best Electronics. We put that in, but in the end, the drives worked worse with it in. We are wondering if something is wring with the drive (maybe serial port.. not sure). We put the WD-1772 chip back in just so the drives wouldn't error out as bad.

One thing is for certain.. after repopulating the SCSI terminators on the board, we were able to connect a SCSI drive (one gig) and that part worked great. It was beautiful seeing what a TT030 could do. Especially this one that was once sold to be a parts machine.

We know the midi port works because we hooked up a midi keyboard and played the Archon theme with it.

I'm elated the 030 has come this far, and I would love to find out how to get the ajax chip and floppy drives working and test for sure to see if the serial port works (we tried some null modem work with Chris' "Atari Floppy Firewall" making networking at 115200 through a null modem link possible) or if those ports do not.

Something to test this week. But definately coming along.

Hmm, have you thought about using some other fileselector such as Freedom?

With that one you can disable it on a per-program basis.

Perhaps there's something about the way that Boxkite draws itself on screen
that your graphics card driver doesn't like.

> of it 'cause it is very convenient compared to
> the standard MagiC fileselector. I'll keep going

Better use that than lose a lot of work.

Hi Clint,
My Falcon/Yamaha R/W SCSI external is set up with the following:
--- Uwe Seimet's HDDriver
--- To read a CD only : Extendos Gold (Anodyne Software)
--- To Read/Write : CDWriter Package (Anodyne Software)

Have fun,
John G.

Rubbish. Benny's crap is as on topic as the fat homo (or whatever) posts but
they do have one thing in common, they don't belong in this group.

You might be able to get a cheap old Atari SM124 on eBay. Small, but
brilliant display.

What version of Zcontrol are you using? On the TT030 running freeMiNT
Zcontrol v 0.25a displays as expected 01/07/03.

Or just buy a second hand one locally...

Where are you? Your .se indicates you are in Sweden. A guy in Norrkï¿½ping usually have SM124 monitors for sale.

This weekend there will be an Atari Computer show (Nordic Atari Show) where you might buy one. (Preivious years there were plenty on sale, but you never know...)

At this show you will be able to ask (and get good answers) any questions you can think of... A lot of Atari experts at one place.

And of course we would like to see you as a member of SAK (Svenska Atariklubben, Swedish Atari club) for a modest 175 kr/year. You will get a printed magazine published quarterly. Sometimes we are behind but we try our best...

Check out http://sak.nu/ for details!

Thanks guys for the Feedback/Responses etc.

I've got my CD rom to work after many hours of hassle with different
stuff. =)
Now that I have a CD attatched... I got to burn many games and demos
off the net to load
on there. :)

However, still lacking NVDI.... (which, is that freely available or
what?)

Thanks!

Clint Thompson

Didier,

Using more advanced DSP's like 563xx and such would you be able to do it
on those? I would imagine that those have more on chip memory available
inside the DSP.

Thanks

Source record: 25824

Well, i found a totally awesome atari 520stfm from the garbage of the "company" i work for. It's in hell of a good condition, original package, no scrathes or dirt on the keyboard, all manuals and floppoies + plus a game with original package and manual, all wires. It's almost like bought from the shop, except there's one pencil mark, and the package has suffered, but the machine is great. Anyway, there has to be a BUT. The but in here is taht the floppydrive seems to be dead. It won't read the game disks(original, in very good condition outside) (didn't try with the original atari disks, cause i don't want to ruin them). I tried using a PC 1.44 meg disk (cause i don't have 720k) and format it, but it won't do taht. I opened the case and the floppydrive and used air to clean it (yes, the machine had been onpened before), no luck. So, cna i use a PC floppydrive instead? Anyway to make a PC floppydrvie working through the external connector (with PIC or something)? Any ideas?

>So, cna i use a PC floppydrive instead?

Yup, just change the switch/jumper/solder spot on the back of the PC floppy
to channel 0

>Anyway to make a PC
> floppydrvie working through the external connector (with PIC or
> something)? Any ideas?

Yup, I did that - its direct wiring (where one pin may say 'side 0' and the
drive may have 'side 1' pin - i believe thats an old typo - because all
disks read fine). Only trouble you may have is finding a 14 pin plug to fit
the ST.
And power.

I fabricated a plug by pushing large bits of wire in and putting lots of
hot-melt glue on it, works a treat!

I got power by adding another floppy power connector from inside the ST.

Dan.

I'll be suprised if there is no internal fuse. But then again, over
here -there kinda picky on that - 'everything' needs a fuse!

Check the capacitors on the supply too - if any are even slighty raised,
then its usually a gonna (and sometimes causes the fuses to blow). If the
caps are bad - just replace them with same type (the voltage can be higher,
but the fahrad rating must match as close as humanly possable)

Dan.

Ok I checked and there is a fuse in the P/S. It looks fine. The keyboard
does not have a fuse at all. I really hope it is the PS that is bad. I
ordered a new PS it should be here any day. Normally if a computer like
Atari/Commodore shows no signs of life it is the PS right? (ie no power
leds, etc)

Tim

> Can someone answer me on who Ben Smith is?

I am probably one of the few people on this newsgroup who has actually
met Ben. Actually I am not a reader of this newsgroup but one of his
ads was crossposted on another group and I followed over here.

I went to his home probably like 3 or 4 years ago to buy a computer
monitor and I had and still have no real interest in Atari beyond just
general interest and am not a collector. My first impression of Ben
was of a very eccentric person, maybe even a bit "slow" as in learing
impaired or however you want to put it. He lives (lived) in a small
home that was in pretty bad disrepair and was frankly pretty filthy
with Atari stuff virtually in every nook and cranny, with a small
office setup in his kitchen.

He was proffesional as far as the deal went and while the product
seemed a bit overpriced it worked fine so I have no complaints there.
The only thing I really remember was wanting to get out of there
fairly quick because of the condition of the house.

So there...a real unbiased opinion on who Ben Smith really is.

Hey, first off I had no idea that there was that much discussion about
Ben in the first place on these groups. Like I said, I came here from
a message that was crossposted and saw all of the discussions about
Ben and thought to myself "hey, I know that guy". And then I saw the
thread that I replied to.

What I wrote was just what I recalled about my dealings with him. I
did not go into calling him names like a lot of other people here
have, I strictly wrote what I remember of the encounter of 4 years
ago. Would I buy something again from him if I was interested in
Atari hardware? Probably. Would I go to his house again like I did
to buy it in person like I did before? Most likely not. So therefore
what I wrote is relevant.

The iDiot Forever Known As Sinclap wrote:

> > Bring it on.
> >
> > sinclap!
> > "Who needs 64 bits, thats why I love my Atari!"

remember, this is the idiot who lost all credibility when he stated emphatically that if Steve Jobs ever came back to Apple he would "destroy it before he even got started" and called Jobs an "arrogant bonehead" - and the moment Jobs DID come back to Apple, ol' TiFKAS began applying his tongue to Steve's boots.

This is also the idiot who stated, when Connectix came out with a program that emulated a Sony Playstation, TiFKAS triumphantly predicted that Sony would be licensing it real soon. Reality: Sony's army of humourless lawyers basically crushed, killed and destroyed Connectix's defense, forcing them to give Sony the code, and Sony placed in deep in Davy Jones' locker - and left a large smoking hole where TiFKAS' ego was.

Or let's not forget another of TiFKAS' "triumphs" - when he stated that, at a Macworld Expo, he saw some incredible new MIDI programs from Adobe. Which he will still whine and stamp his little foot about, first claiming he "never said it" and then when presented with the evidence he did, then claimed it was a typo....

No, TiFKAS, you may have once been a big bad troll once, but now you're simply sitting there waiting for someone to stick a fork in you to see if you're done. Just think, all these years and he's still wasting his time trolling Atari newsgroups just to get attention - and yet still too chicken to post in comp.sys.mac.advocacy, because he knows if he goes in there he'll be reduced to onion rings in seconds. Too bad, because there are some great Wintrolls there who are TiFKAS' own IQ to play with :)

The only real claim to fame TiFKAS has ever had was when Jeff Minter called him a "wanker, a toss-pot and a turd" - and he was right on all three counts :)

4312. STE and Seagate Hard Drive Difficulties

Newsgroup: comp.sys.atari.st
Date: 2003-07-02 02:38:31 UTC
From: Paul Nurminen <visit_my_site@nurmix.com>
Message-ID: <j4g4gvk5valoqivund9qhgruf4mssb03m9@4ax.com>
Source record: 25843

I've recently set up a 2.1 gig Seagate hard drive in an external enclosure, to use with my STE. The drive is model # ST32155N. I've installed SCSI hard drives in cases before, so I am familiar with the procedures involved.

Anyway, after I first set it up, I did the formatting and testing on my Falcon, since at the time, I was still waiting to receive a used ICD Link 1 so I could connect the drive to my STE. The drive works fine on my Falcon, however, when connected to my STE through the Link 1, it is not recognized at all.

The Link1 works fine with another SCSI drive I have (a SyQuest EZ135), but there's something about the Seagate that it doesn't like. I know that it's not a termination issue, as the internal termination of the drive is disabled (and it is terminated externally). So the only thing I can think is that it's a parity issue, or perhaps the drive requires termination power? (something the Link 1 can't provide, right?)

I do notice that even with the Falcon, the drive won't really spin up _until_ the computer is powered up.

So, any thoughts on what might be causing the trouble? Do I need a Link 2 instead?

If you were even telling a nanoparticle of truth, you'd know what state, city/town, and address you were at while "porking my missus" (I know EXACTLY where I live... do you?). Sadly, however, the degenerate primate testicle, you call a brain, can't even fathom anything less than a stupid, endlessly repeated insult.

How many times have you defaulted to insults concerning my family? When you can't think of something original (which is most of the time), you go right back to insulting my family. Gee, how original. You're worse than a broken record. No, in fact, your brainpan is so flat, they stick a stylus on your head and spin you in circles to play music! But, unfortunately, you're so full of ovine lust and stupid thoughts, all they hear is backwards masking of bad rap music!

You see, no matter what you say, I will *ALWAYS* have an original insult to come back with. You, on the otherhand, haven't a chance of such advanced thought processes... but you're welcome to try.

Don't worry, I'll try to catch the fortune cookie fragments, if your head explodes from the effort. See? Another ORIGINAL insult! How many does this make? I'm losing track... 20:1? 50:0? Eh, who cares... I'm winning.

For a moment, I thought I had a manual on that drive. The "N" on the end
is suspicious although I do not remember what it means. But there are two
jumper points named "enable motor start" and "delay motor start". You my
need to jumper "enable motor start" and un-jumper "delay motor start".

So, you need to look at the Seagate web site for that number, find out
what the suffix means, and where are the motor jumpers. I vaguely remember
some suffixes caused problems.

I do not have a falcon, but for anything else, the drive has to spin up
first.

Your intentions are good but the truth should be known kind sir,
Ben does live amoung his inventory and he can be called 'special'
if you get the meaning in its full intent without being cruel.
His life IS second hand Atari equipment - PERIOD. Without his
Atari business he might lose his home and without his home, he
would easily fit amoung the 'homeless'. Who amoung us would
openly laugh at a homeless person? There, but for the grace of
God, go I.

To call him a faggot or otherwise belittle him is to show one
of the ugliest sides of human behavior. And to those who claim
'Oh, But I didn't know...' I say sure, like that would have
mattered a bit to an ankle bitting troll. Can we please kill
file the flamers NOW?!

If you don't get it directly from soundpool I could sell you mine.
I also could offer the analyser and equalizer modules for Audiomaster.
But you'd have to be patient since I'll be away from tomorrow for
three weeks.

Gerhard

The N suffix on seagate drives means SCSI. ('A' is for IDE).
I would also suggest looking for the motor start jumper, but I dont think thats your problem with the ST. The fact that the drive is not recognized on the ST is probably due to an incompatibility between the link1 and the drive. Something in the back of my head is saying "Parity", but I cant be sure. Try searching comp.sys.atari on google groups.

Smeg.

Hi,

Anyone have a copy of TOS 2.0.6 in English
for a Mega STe (2 chips I think). I've got TOS 2.0.6
in French fitted - but this seems to require an AZERTY
keyboard.

Cheers

Bob.

I'm not sure what "WTD" means, but I'd love to purchase that English TOS 2.06 from you.

Thanks
Mark

PS: Are they tested working?

You can find 2.06UK Roms on the net.
Juste use google with atari 2.06 roms

Be careful if you're going to split the image onto two eproms. Some of the file splitters I've tried were only designed to work with earlier TOS versions, and stop before reaching the end of the larger 2.06 file, producing incomplete eprom images.

Hu, I'm sorry I don't have a TOS 2.06 in english, but I would be very
interested by that french Tos 2.06 !
Do you think some deal is possible ?

Dbug (that have a Tos 2.05 in his French MSTE)

>sure.

Thanks for the tips guys.

I believe I've figured it out, and I don't think it's the start delay,
as I've noticed that when connected to the Falcon, it will spin up
without the computer being ON as long as it is also connected to
another terminated drive. When it's connected to the Falcon alone,
with a terminator plug connected, it waits for the Falcon to power up
before the BUSY light will go out and the drive will spin up. In
other words, I believe it's waiting for terminator power to come over
the SCSI bus before it gets going.

Anyway, I opened the drive up again today, the first time since
putting it together a couple months ago. I think I must have misread
the Seagate install guide/manual back when I first got the drive and
installed it in the external case, because I thought by default, that
both parity and "terminal power from SCSI bus" were disabled. Looking
at it again now, with the drive in front of me, I see that I need to
jumper the connections to set both of these:

- a jumper to "disable parity"

- a jumper to enable "terminal power FROM drive", as opposed to from
the SCSI bus - although I think it's only the parity issue that's
causing the STE to choke.

The only problem now is that I don't have the right size jumpers to do
the job (the drive was bought used, and didn't come with any)! I have
several in a bag in my "PC/Atari spare parts box", but the pins on the
drive are too short for any of them to work. I know I could jumper
them with just about anything metal, or solder them, but in case I
want to use the drive elsewhere in the future, I'll keep my options
open, and pick up the right jumpers at the store as soon as I get the
chance.

I'll let you know if it's working after this.

4331. What's the difference between a 520 ST and a 520 STe?

Newsgroup: comp.sys.atari.st
Date: 2003-07-02 21:19:05 UTC
From: mikhol@tiscali.se
Message-ID: <5d166f51.0307021319.7782bf4d@posting.google.com>
Source record: 25863

Hi,

I posted the other day about my newest addition to my computer park, a Atari 520 ST I thought. Well it was a 520 STe... There was a microscopic 'E' beside the T in ST.

Now I'm just wondering what the differnce the 'E' does make?

// Mikael

4332. Programming utilities and docs suitable for a 520 STe?

Newsgroup: comp.sys.atari.st

Source record: 25864

Hi all,

I'm searching for some programming tool for my new 520 STe.
Assembler, C, C++, BASIC, Pascal etc... Almost anything goes. Any
recommendations from you guys?

Is there any nice freeware tools? I guess that GNU C (gcc) if ported
to the Atari? Does it work with my computer?

And I've heard that STOS is freeware nowadays. Is it so? All I could
find was the ASM-source. I need the binaries as I dont have any
assembler yet. And even if I had one, I wouldn't quite know how to
make the runable STOS Interpreter
and Compiler. Does anyone have assebled it successfully?

Regards,
Mikael Holm

The STE add the following to the old machines of STF/STFM kind:
- Memory can be upgraded using SIMM modules instead of require soldering
- Two new analogique joystick ports on the left side, that can support
Jaguar pads or light guns
- Tos 1.6x instead of 1.1/1.2
- Blitter in standard to accelerate drawing
- Digital DMA sound that can play a 8bit stereo sample up to 50khz +
treeble/bass microwire controller
- 4096 colors palette instead of 512
- Support for smooth hardware scrolling and multiple splitted screen modes

I suppose that's all :)

You practice an old tactic of evolutionists, known as "switching the burden of proof". But I say, since you're the one MAKING the claim of having sex with my wife, you should be the one required to PROVE it!

Afterall, I already DON'T believe you, so why don't you show me how much of a "missus porker" you are and tell me where she and I live, eh?

Specifically, "N" stands for "Narrow", the 50 pin SCSI connector.

Look at http://www.seagate.com/cgi-bin/view.cgi?/scsi/st32155n.txt for
your jumper needs. Offhand, I think you'll need to jumper 1, 4, and
6, but I seem to recall working on a Seagate drive where the "motor
start" pin was really the "no motor start" pin.

Best of luck,

Galen

You guys are all drivelling idiots!

AAPL is the stock market symbol for APPLE! Type in "AAPL" in the NASDAQ
symbol search field.

Sinclap is correct in this. I checked.

Hi,

Im not sure what you actually intend to write, but I used or have come
across:

GFA BASIC - Excellent general purpose (mostly Apps) basic interpreter with
compiler. This worked great on my STE, and I managed to write a few apps,
mostly to test hardware I built. (STE Lightpen anyone? :-)
STOS - Same as above but geared more towards gaming. AFAIK it is freeware
and is downloadable somewhere... I used to have the original which didnt
work properly on my STE, but I managed to half finish a Manic Miner clone.
Lattice C. - Didnt use it much, wouldnt compile stuff never found out why -
just about managed the "Hello World/n/n/" bit.
Devpac ST V2 and V3 - Best 68K000/30 assemblers with debuggers. Great for
writing games, apps, anything you like, I used to use this all the time, and
even cracked stuff with it. There is Devpac DSP aswell, for the Falcons DSP
(obviously), and there are loads of CPU/DSP
assemblers/disassemblers/debuggers available that are shareware.
Hisoft C. - Got it but havent used it yet.
Pascal - Eurgh I wouldnt touch it with *your* keyboard. :-)

As far as I know, most of this stuff is still commercial (but unsuported)
only STOS to my knowledge is free. I think Hisoft (Last time I spoke to them
was 2001) is still selling (or offering for sale) Devpac.

Smeg.

(I have lots of stuff on my hard disk, if you want anything just email me).

Apart from making the machine incompatible with about 30% of existing games
and a *few* apps...

> The STE add the following to the old machines of STF/STFM kind:
> - Memory can be upgraded using SIMM modules instead of require soldering

Some of the later STe's came with SIPP modules, which are SIMMS with little
soldered legs, you would have to solder these in.

> - Two new analogique joystick ports on the left side, that can support

> - Support for smooth hardware scrolling and multiple splitted screen modes
>
> I suppose that's all :)

There were also stereo phono (cinch) sockets on the back, and the first
model STe's had a faulty DMA chip that could corrupt your hard drive IIRC.

Interesting, but are you sure about this? Im thought Seagate been labelled thier SCSI drives with an 'N' well before SCSI Wide was even invented, even though they do use the 'W' label for wide 68pin. At least I remember seeing seagate SCSI drives in the early 90's that were suffixed 'N' and it wasnt till a lot later on that we saw Wide SCSI.

> The Link1 works fine with another SCSI drive I have (a SyQuest EZ135),
> but there's something about the Seagate that it doesn't like. I know

The Link gets its power from the drive(s) that are attached to it. For this to happen at least one must have the jumper set to provide TERMPWR to the SCSI bus. You will have to get the drive docs from the mfr. website to determine which one.

Have you tried the Syquest in the chain at the same time as the problem drive? Be careful about the usual termimation and SCSI ID issues.

If you only have a single disk drive consider getting Sozobon "C" and the
GULAM CLI. This has a built in micro EMACS and will all fit on a single
floppy. There are ports of GNU but you must upgrade to 4Meg (just pop in 4 x
1 meg 32 pin sims) and its hard to cram it all onto a single floppy so you
probably need a hard drive upgrade. You can just about squash a 2.5 IDE and
interface into the STE. Look at Mario Becroft's site.
http://gem.win.co.nz/mb/ he has agents around the world. Alternatively
Keychange (www.keychange.co.uk) do one.

> Is there any nice freeware tools? I guess that GNU C (gcc) if ported
> to the Atari? Does it work with my computer?
>

There are older versions of GNU at http://www.umich.edu/~archive/atari/.
which are smaller and will therefore fit on a single floppy.

I'm currently having a Christmas in July Sale! This is how it works. Buy the HardWare/Accessories for any Classic Atari 8 Bit and/or 16/32 Bit Atari ST System and I'll outfit your system with Games/SoftWare and/or Books/References. You be good to me and I'll be good to you! The more you spend on HardWare/Accessories, the better I outfit your system. The more HardWare you buy for your system, the more Games/Software and/or Books/References you receive! You choose the Atari Hardware you want to buy and we choose the Books/References and/or Games/Software I'll include in your Order.This will be a good opportunity to renew lost interest in collecting Atari or building a New Atari system for the first time. ReLive your Atari Youth! Offered While supplies last. Goto http://BensCatalogs.Atari.org or Call Ben anytime at (503)256-9974!!! To proceed with offer HotLink to:

http://www.aracnet.com/~atari/specials.htm Atari Specials!
http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!
http://www.aracnet.com/~atari/maillist.htm SignUp for Ben's Mail List!
http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

The ST does not give a 256 color display (only 16, 4 and mono).
Now an Atari Falcon would do that. Nice machine...

I am not sure you can do this. If you want a high resolution
display you can either buy an Atari Mono monitor or else get a VGA
adapter which will allow you to use most any PC monitor for high
res. If you were to get a piece of Atari hardware called a Video
Key and a video converter, you could also use the PC monitor for
low or med resolution display.

> and Compiler. Does anyone have assebled it successfully?

The source code was made freeware for the purpose of allowing people
to develope it further, I'm not sure how this affects commersial
copies of STOS though as it may be considered as a seperate entity as
it is possible from software to be made freely available (eg freeware)
while still being covered by copywrite as it is free and not Public
Domain.
If you were to search the internet you could probably find working
copies for download or you could support one of the few remaining
Atari retailers (thus ensuring there continued presence) by purchasing
a copy.
IIRC B&C in the US, 16/32 Systems in the UK still stock copies, you
could also try Bravo Sierra Computers (US) and Trade in Post (UK) for
slightly cheaper second hand copies - WARNING: last time I tried
accessing the Trade in Post web site I was prevented by an alert
informing me of a virus on the main web page so enusre your virus
checker is up to date and opperational.

Not for high res. However if you have been just feeding the TV via the arial
socket then using an good RGB interface instead will significantly improve
things. I found that on my TV text in medium res was unreadable. On an RGB
monitor it was fine. You must get an analogue RGB monitor not TTL.

> >I have a Commodore 1901 monitor with a RGBI input and Chroma/Luma

Probably in low and medium res, with improvments but not for high res, see
below...

4366. For sale: A copy of Thomas & Thomas: ☐The Complete Beginner's Guide to the Atari Portfolio'

Newsgroup: comp.sys.atari.st
Date: 2003-07-03 16:08:09 UTC
From: r.purves_usenet@ntlworld.com
Message-ID: <6f9bddfd.0307030808.10de0848@posting.google.com>
Source record: 25748

For sale: Paperback copy of Thomas, B & Thomas, A (1989) ï¿½The Complete Beginner's Guide to the Atari Portfolio', (Derbyshire: Thomas Technical Publications)

I have an ex-library, well-read copy of the above book for sale. It is covered in a protective plastic film and the front cover is somewhat creased. A previous owner has annotated the odd page with pencil marks.

I really want to see this book go to a good home. The price is 4 UK pounds or 6 euros, depending on the buyer's location. The buyer would also pay for postage from the United Kingdom. I am very happy to send this book anywhere in the world.

For more information, please get in touch at r.purves_usenet@ntlworld.com.

Many thanks
Ross Purves

You attempts at "slight of hand" are futile. The statement is to have HIM
(Steve Sweet) PROVE (provide overwhelming or undeniable evidence) that he
knows where I and my wife live. But maybe you don't know how to read
English (or suffer from some variation of dyslexia) and thus are lead to
believe I meant something else entirely different.

You know, Ben, not to be mean or anything, but...

Didn't you just post this exact advertisement last week or so?

Hyper-repetition is not going to win any converts/buyers over any faster.
And I think upgrading and repairing your site and providing an URL to it
would yield far better results.

But, if you're doing it just to annoy the blazes out of all the lamers here
that are attacking me... go right on ahead. ANNOY THE SHIT OUT OF THEM!!!
WHA-HOOOO!

Oh, and send a few dozen ads to "Anonymous"... just to put a few more fleas
in his hair and annoy him tremendously!

Jus' my $0.02.

Luposian

Didn't know that. Some falcons have that problem, sure, but didn't know for the STE.

Also can signal the bug of the pre 1.62 TOS (1.60 and 1.61) that are not able to correctly save the middle resolution desktop settings, and that ask "do you want to view that document" when double clicking on a PRG program from time to time.

I agree that the site needs some work. But I think the problem is that
"Bravo Sierra Computers LLC" needs to hire some more people and maybe
actually incorporate for that to happen! ;) LOL

OH, FOR JOY! I MADE THE LIST! I AM SO HAPPY! MY LIFE IS COMPLETE!

Now, let's see here... who can I tell this wonderful news to!

Steve Sweet? No... he's too busy porking my wife and sheep (hey, I don't recall owning any sheep!)
Clockmeister? No... he's too busy agreeing with Steve.
Anonymous? No... he's too busy trying to convince the entire atari.st newsgroup that Benjamin Smith is a 400lb GAY salesman.
Everyone else on this newsgroup? No... they all think I'm crazy for trying to get Atari to make hardware again.

Rats... can't think of anyone... guess I'll just have to keep this wonderful news to myself... :-(

4383. Ghostscript?

Newsgroup: comp.sys.atari.st
Date: 2003-07-04 05:50:56 UTC
From: Something <*****@*****.***>
Message-ID: <*****-6D2024.01505404072003@news.indiana.edu>
Source record: 25765

Hi

Although I am a longtime Mac user I still own three STs and use them occassionally to print out Postscript files. This is done by Ghostscript and so far has worked nicely with files created on the Mac.

Now I switched to InDesign 2 and the PS files created won't render on the ST in Ghostscript.

Is there a website for Ghostscript ST? Ghostscript is even used to print under Max OS X. Anyway, it's a silly question but this has been the only justification to leave my MegaSTe set up on my desk.

Thanks

Peter Kienle

Hello, Martin

I'm using the same Zcontrol v0.25a on my TT030.

You can't enter 30.06.03 in Zcontrol, but when I enter

23.59.45
29.02.02

then after midnight it will show:

00.00.01
30.02.03

and I'm sure you can do the same with the dates of
30.06.03, 30.11.03 etc. just before midnight....

For Auction, complete set of ST Format
magazines from issue 1 through to 86.
All cover disks except for the second
cover disk on issue 33, and a cassette which
was apparantly on issue 12 (never did see
that). Low reserve.

No the later ones. Atari decided to try and sell thier own RAM upgrades
through the dealerships so they put sipps in, instead of simm sockets. It
didnt work obviously.

Yeah I had TOS 1.60 so I had this bug, but as I never had a hard drive I cant recall it (or the DMA bug actually) affecting me. I never heard of TOS 1.61. I thought it went from 1.60 to 1.62 (at least in the UK).

I don't know of a Web site for Ghostscript ST specifically, but the main
Ghostscript Web site is http://www.cs.wisc.edu/~ghost/. You don't say
what version of Ghostscript you're using, and I've never used it on an
Atari, but my hunch is it's probably fairly old. If so, there's a good
chance that InDesign is using a more recent version of PostScript than
your version of Ghostscript can handle. I suggest you look for
PostScript-generation options and try disabling the more advanced
options. If necessary, set it to generate plain Level 1 PostScript.

Ok! This is as far as I could get:

Ballerburg (2)

Some words' translations are somewhat obvious to me and some are not!
(note that accent marks are missing).

Words found in my German/English dictionary that are most clear:

Spieler - player
Konig - King
Fertig - finished
Weiter - next
Auswahlen - select
Einkaufen - shopping
Geld - money
Geschutze - gun
Pulver - gun powder
Windfahne - weathervane
Kugeln - bullets/shells
Kunstliche - artificial
Linken - left
Rechten - right
Dummel - stupid
Optionen - options
Winkelsl - angle
Maus - mouse
Echtzeitwind - realtime (contstant wind change?)

Words that may need clarification of intent or use in the game:

Fordenturme - looks like an oil drilling rig
Steuren - stearing
Regelen - regulate/rule/settle
Volk - nation/people
Anbauen - grow
Erlaubt - able
Springendes - bounce/dive/hop
Spielstarke - play strength
Verkehrt - unsound/upside
Spieldauer - # of rounds
Kapitulieren - surrender?

These I could'nt find (names, maby?):

Ubernommen
Tolpel
Brubbel
Wusel
Brosel
Toffel
Rupel

Also needed: the king's comments and game instructions!

John G.

The GemGS 1.3 version, based on Aladdin Ghostscript 6.01, is not actively supported or updated by Chistian Felsch anymore, but everything (binaries, sources, fonts, docs) is still available here:

http://www.tu-harburg.de/~aluminfc/amua/download/atari/gemgs/

For FreeMiNT there is a rpm package of Ghostscript-6.50 available on the SpareMiNT site.

I use Ghostscript a lot to print out music scores, made with my Atari port of abcm2ps. Looking great.

It would be nice to have an update of both GemGS and SpareMiNT Ghostscript though.

There's no web site for the Atari version of GhostScript, and I believe that
it's safe to say that it won't be updated any more.

It might be worth your while investigating Porthos though, this is still
being updated and a demo version can be downloaded via the Calamus web site
(link is via the Newsticker page).

> it's safe to say that it won't be updated any more.

I wouldn't be sure about that. On a FreeMiNT system it shouldn't be such a problem to compile a newer version. On a fast Aranym machine or using a cross-compiler on a fast Linux PC it doesn't take many hours anymore.

The sources for the special GEM version - that doesn't need MiNT - are also available, and someone may pick them up and integrate them with a new Ghostscript version.

After some more studying, I may even consider trying it myself.

Porthos doesn't handle PS files. It also will not handle PS files in
future (I asked the author). But for PDF files it is great and getting
even better. The demo only displays one page. I recommend to pay those few
Euro to get a full licence.

I don't mind facts but what I was saying to Luke is that he went, he
purchased and he got what he wanted. But then to describe the persons
house in that way isn't stunningly nice whatever you think about the
person.

It's like you coming round to my house, buying an item, being happy
and then writing on the net "Oh I got what I wanted but he's a bit of
a mong and his place is a shit hole".

Both untrue I might add ;-)

What I was saying to Luke is that he wasn't actually answering the
question in the subject, he was making observations about his
belongings. His comments re his thoughts on Ben's mental state are not
the deal, that's his opinion of Ben and I've never met him myself so
it's not for me to say what he's like although his adverts don't
exactly do him proud.

Hi, John!

Some "corrections" - I hope my english is understandable...

JG> Fordenturme - looks like an oil drilling rig

Förderturm - "tower" for lifting mining products

JG> Steuren - stearing

Steuern - taxes/fees

JG> Regelen - regulate/rule/settle

Regeln - rules

JG> Anbauen - grow

Anbauen - in this case: repair your castle (place additional bricks on
your walls)

JG> Erlaubt - able

erlaubt - enabled (not sure about the context...)

JG> Springendes - bounce/dive/hop

springend - bouncing (not sure about the context...)

JG> Verkehrt - unsound/upside

verkehrt - wrong (not sure about the context...)

JG> Spieldauer - # of rounds

Spieldauer - elapsed game time, well "# of rounds" is the same idea

JG> Kapitulieren - surrender?

yes.

JG> Ubernommen

übernommen - to have overestimated ones abilities

JG> Tolpel
JG> Brubbel
JG> Wusel
JG> Brosel
JG> Toffel
JG> Rupel

This is a set of names for the computer opponents. The names' sounds or associations give an impression about the way they behave.

You have the entire internet at your finger tips and you have to have
someone explain it to you. Why should I waste my time explaining it
to someone who doesn't wish to lift a finger to discover anything on
their own. It's been out for some quite some time, ever try google?
Find the page and read it yourself.

Well, well, well. As one of the "diehards" (I only lasted until about February 1999, owned two Falcons (broke one with a FalconSpeed, damn!) and a CaTTamaran with Nova), I can't say I'm all that surprised there's a bunch of you that make me look like a lightweight! :^) Still have 4 MB ST w/ 2.06 for games (not that I've touched it in 4 years).

Anywho, cleaning out the garage I found ST Formats #2 thru the bitter end with disks (and some other assorted mags), a RAMGizmo that I'm 99% sure works, and a 13 pin ST monitor cable with exposed leads (for repairing the newer monitors).

If anyone's interested, speak now or forever hold your peace. I imagine the mags would have to be picked up in San Diego, due to weight.

Ehh, and lay off Ben. Jeez, there's so few of you guys left, you shouldn't be growling at anyone, unless maybe they ripped you off.

Fuji forever,

Dan

Hmm, you still refuse to see the truth it seems. MiNT-net is indeed the
only Universial Stack on Atari. IIRC Iconnect is not a stack at all so ...
It's about time you face the fact Magic is a dead end. It's only because a
kind Greec soul who make networking possible by means of magicnet (would
this be possible without MiNT-net?) magic is still around here and there.
The future is FreeMiNT with or without Aranym.

And if you like it or not the day you will use one of another Unix variant
is coming nearer and nearer. AFAIK the developement of programs for MacOS
9 or earlier is nihil. Everyone programs under MacOS X nowadays and
suprisently lots of new stuff is coming from the world you regard as an evil
world.

Dennis,
I would have to say that Dennis is right on the
concept of a SCSI adapter for USB. Could be done
relatively easy I would think. The only problem that
remains would be suitable drivers to run various USB
devices. BTW, Dennis have you been able to recieve
any of my past e-mails?? Let me know via this group
or the one that I listed in my e-mail to you.

Talk more later,
Thanks,

Martin,
I love your web-site and I visit it quite often.
But to say that Mint and MintNET are the only options
for the Atari is very short sighted. I myself have
used regular TOS 4.0 and 1.6 and for the last 3 years
have been using Magic 6.x and Jinnee 2.5 with my
Falcon quite happily. Yes, I believe we should thank
that guy from Greece (THANKS Vassillis P.) for all his
hard work. Without it we as Magic users would not
have ethernet capabilities and cable modem access. I
personally love Magic and Jinnee because of its
extreme flexibility. I guess this is just one of
those debates that will go on till the end of time.
BUT, I believe we should channel this debate into
something constructive, like how to make Atari as
platform be more recognized than it is??? Think about
that for awhile before responding with hot-headedness
and sayings that MINT is the ONLY OS for Atari.

Just my two cents.

4434. Falcon IDE dead.

Newsgroup: comp.sys.atari.st

Source record: 25715

Hi all.

I have received a Rev B falcon motherboard, which otherwise works fine, but when I attach my 2.5" IDE drive from my working falcon, the drive will not spin up on booting. If I dont attach a drive, the hard disk driver reports an IDE device on both ID's, of course its wrong and it gives rubbish characters like: "������������������" for the device name.

Can anyone give me a few pointers, or a few things to check? What usually is the first thing that causes this?

BTW, i think someone installed a 2.5" to 3.5" adapter at some point in the past because the large cap next to the modulator (C24) has been desoldered and raised at one end.....

Regards,
Smeg.

Not very short sighted, its simply the truth. Unless Magic author release
his brainchild as freeware, Magic is dead. Tell me who wants to buy a dead
OS. I surely not. I prefer a OS which is constantly under construction and
which opens a window to lots of exiting things once we'll have fast
machines which runs natively Freemint. I'm playing around with Linux since
a few days and I can tell you there are lots of very good items there.

> love Magic and Jinnee because of its extreme flexibility. I guess this is
> just one of those debates that will go on till the end of time.

Indeed once in a while such debates comes up and dies out. It's always
better then those Benny debates from that anonymous brainless guy.
I've MagicMac/Jinnee. On the 300 MHz G3 it's fast indeed, even faster then
my Hades but I must say I really don't like it. In my eyes
it's an OS without a soul. It give me a feeling of the OS is telling me
what to do. With MiNT (with or without MiNT-net) I have the opposite
feeling. I'm telling the OS what to do. I'm the boss not the OS.

> BUT I believe we should channel this debate into something constructive, like
> how to make Atari as platform be more recognized than it is??? Think
> about that for awhile before responding with hot-headedness and sayings
> that MINT is the ONLY OS for Atari.

Hmm, I don't think I've said that so extremely. I only said MiNT-net is
the Standard TCP/IP stack, which it is as Iconnect is strictly speaking
not a TCP/IP stack. The development of Magic seems to be halted, which
can't be said of MiNT, XaAES, Terra ...

Ok, I'll close my mouth now. I've said what I had to say.

Take care,
Martin

Martin,
I did not mean to come across as bitchy or anything
of the sort. Matter of fact when these debates heated
or calm either way, come up. It kinda makes me wonder
why we dont channel the discussion towards some sort
of solution. You, Dennis, me and many,many, many
others all want one thing for our beloved Atari
Machines. To be useful and productive well into the
future. I am not a close minded person but I would
have to say that I have never used FreeMint or any
Mint deritive. Not to say that I would not, BUT I
would have to do alot more reading on it before
attempting to install MINT. I have heard horror
stories. But I believe with as much talented atari
users out there we could come up with some sort or
MULTI-OS computer that could run both OS's at the same
time without rebooting. Would this be possible??? We
have proven that multiple TCP/IP stacks can be used at
the same time. I use Iconnect and STING clients at
the same time thanks to MagicNet and Downloads are
very fast on my Falcon. At least 50 K/sec to 75 K/sec
on average. But it would seem that this debate would
go on for years unless we were all sitting around a
table drinking a brew an dicussing how this could be
done.

Just my two cents,
Thanks,

Feedback on Bravo Sierras (Ben Smith's) sales.

Bravo Sierra Computers wrote:

> Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
> Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari

You've seen his adds and sometimes referred to SPAM.
I'm a recent customer.
Sorry, not a regular poster here and don't have time to catch up on all the posts either.

Here's my feedback for you about Ben's sales - some good some bad.

Negatives:
Advertises too often, possibly considered spam to the newsgroups.
The information on his site makes him seem to be less reliable than a typical dealer.
- ie typos and poor grammar etc.
The same goes for his business emails to customers - a bit confusing at times.
Does not always reply back to the question or questions you ask.
- possibly just too busy with orders and emails.
Does not have a great system for keeping his inventory, but not too bad - he'll work it out eventually.
Does not accept personal checks, takes US postal service money orders only.
- this adds extra cost to each customer.

Positives:
There are not that many folks selling (trading/buying) Atari computer merchandise.
- so one has to factor in that into your search for Atari computer products.
Prices are not too bad, and he has a decent variety. Some loose and some NIB etc.
Also carries a bit of C64 and other computers from that era - not just Atari.
Usually replies back within a day, and will eventually figure out what you want.
He did not have a reference list or email addresses for his previous customers
- but he does now have some as I checked him out in advance.
- I didn't check his online site to see if he revised that.
He emailed the status of my payment and order being sent out.
Packaging was fine. Shipment arrived quickly.
Merchandise as expected and fine.
Shipping costs minimized if you want media mail.
He will insure and use priority mail if you do want it.

Other considerations:
I purchased from within the US.
I am somewhat well known to the classic gaming community and so perhaps he made more effort
and care to my order than the average customer.

Recommendation:
Yes, place and order.
It would be worth your effort - but perhaps make it smaller (< $50) at first.
Make sure to go over every detail and do not assume anything.
Verify all items to be purchased and price and shipping and totals.
Save your email messages and his.

I hope that this helps potential customers.
His service may not be as good as other reputable dealers, and a bit confusing in communicating with him, but my experience was good.

Thanks for replying (and sorry for my late reply), but I just need an off-line unpacker, not a realtime streaming application.

All I need are sources for ogg that a) can compile to standard 68000. b) A (very small) routine to load & call the ogg "depack" routine. Could anyone direct me to such sources? (that was kind of my original request)

Thank you...

Well, you've just proven, beyond any shadow of a doubt, that you are a liar.

I and my "missus" live in the USA. You live in the UK.

Now, unless, you rack up a WHOLE LOT of frequent flyer miles, travelling to and from the USA (in under a few hours on any given day), there is NO POSSIBLE WAY you could be "porking" my wife unbeknownst by me.

Oh, and unless she can rack up a WHOLE LOT of frequent flyer miles, travelling to and from the UK, there is NO POSSIBLE WAY she could be getting "porked" by you, unbeknownst by me... unless she can get there and back in under a few hours on any given day.

Lear Jet, anyone? Uh, I don't think so... unless you or she are VERY rich individuals. Not too likely, with the kinda debts she's saddled on my hind to take care of.

People suffer from personality disorders, not cloning disorders...

I find the defendant guilty of sheep porking and gross visions of sexual grandeur with a non-ovine species. Keep it to your own sheep, you pervert! Case closed... court dismissed.

Luposian

> any of my past e-mails?? Let me know via this group
> or the one that I listed in my e-mail to you.

If you go back and read the start of the thread the only thing
I originally suggested was that mint combined with a clone
was a fast track to usb support, in that sources already exist
in the linux world, and the pci bios is a huge head start as
it handles the low level i/o stuff with the pci cards. Then
adapt the idea to other atari's when it works.

A scsi adapter might work, but those are not very popular
and standard and I would bet a lot harder to find source code
for. Also you run the risk of data loss on your HD if something
should go wrong inside the driver. I repeat, I am not dismissing
the idea as crap, just that it would be harder and take longer to
implement. I personally would avoid a SCSI solution, but that is me.

The problem is people like dennis. I presented a perfectly
legit idea, and rather than contribute any solid logical comments
he'd rather call everything I say bullshit. Unlike dennis I do
contribute back to the community, with software, mailing lists, docs,
tips, see my website. Dennis on the other hand has made up his mind
mint is evil, unix is evil, and anyone who uses such things.
He refuses to listen to anything that makes sense. Everyone here
has the ability to look up old posts and see for yourself that
is the case. Seriously, what does Opera have to do with USB?
Absolutely nothing, dennis just likes to avoid the real issues
and cloud everything to the point where the original idea is lost.

As Martin has said, magic is a closed door, and without a 3rd party
hack it would be hopelessly lost. Development should not focus on
such an OS, that's simply a logical conclusion. No OS is perfect,
however since magic has been retro fitted to be mintnet compatible
you can conclude only one thing. Development should start with mint
and trickle the other direction. It's painfully obvious mintnet has set
the standard for networking or magicnet would not exist.

I still am willing to send ozk a pci usb card if someone could help me research the best one to go with, but it looks as if this is not the place for real discussions. I can see I need to move this to the Atari clone mailing list. I don't think I'll bother with this thread again and maybe down the road the 20+ users on the clone list will have usb at least. Then later someone can port that maybe. Certain people here are more concerned with beating down people and ideas for no reason.

I fully expect dennis to go off, that is his prefered nature for I am evil cause I speak the truth. If anyone has a real discussion about usb as I proposed then drop me a line via my e-mail box.

If you have MiNT I recommend this:
http://hardware.atari.org/ether/index.htm
I have this and it works great on my TT, setup time under MiNT, only a few minutes.

Otherwise you need the STing inet stack and of course a broadband inet connection. If you have some other platform at home that you can connect to via ethernet, I would suggest getting the DaynaPort and doing some testing before you jump into broadband. I found the DaynaPort to be unstable and STing far to complex to setup correctly in a LAN.
I dinked around with the route.tab file for some hours and never got outside my LAN onto the internet. It should not be that hard.

Anyway, you might need a router, Atari's don't deal with dynamic IP's so well, and a router can solve this. A static IP is preferable and a lot easier to setup.

>
> What exactly do you mean by this?
>

iirc - the drives have a 'Side select pin' selecting the side of the disk to write to. On pinouts, the internal drive is Side select 0, whereas the external drive pinout, this was Side select 1.

The last thing you want is for the drive to write inverted over the disk, so my initial thought was to put an inverter on the pin, but luckily - after just directly hooking up the pin, found the disks written and read worked fine on any drive.

Thus why I concluded that the fact the external pin labled as Side select 1 must be a typo.

BTW - dont get this confused with Drive select 0 and 1.

So to wire up an external drive - its just pin for pin wiring.

Dan.

Hi..

I have UK English TOS 2.06 files (2 files - one for each ROM chip). Can email to anyone who wants them - mail chart at datafast dot net dot au with your request. include a statement to the effect that you own an original machine and are thus entitled to a legal copy (just to cover my arse!). I can erase/burn chips for you if you supply me with chips; while-u-wait service available in Melbourne Australia :-) Email for details.

Some of the ROM images available on the web are corrupt - beware!

4461. Atari STe - Bad floppy

Newsgroup: comp.sys.atari.st
Date: 2003-07-07 08:06:44 UTC
From: ulf.andersson@odata.se
Message-ID: <e6768403.0307070006.7232bd30@posting.google.com>
Source record: 25743

After 8 years without a Atari I just bought a 520 STe.
When I (in a hurry) came home with my new machine the floppy was not booting.

If I leave a disk on boot up it fails to boot and says error with disk.
If I boot and try to read disk it says error with disk or no disk in drive.
If I try to format a disk it seems to go through the format process little bar moves all the way across the screen but on verifying format it gives error with disk or no disk in drive.

I tried replacing the drive with a pc high density one (modified like sony_144.zip). This didn't work either. Same errors recieved.

I need some help figure out what is wrong or at least some tips on where to go now.

Thanks in advance for any responses.

Source record: 25647

Hi,

Here's a few questions I'm hoping to get answered here.

First,

What's the main differences between TOS 4.02 vs. 4.04 vs 4.92/5.00
(beta)
and does anyone here use or know of someone who uses the 4.95/5.00
(beta) and is it stable, etc. etc.

Second,

Is there some place I can buy a replacement (atari falcon030) inline
sticker?
Just curious?! :) Mine isn't perfect ;)

I know there's more questions I have but just can't think of them,
I'll be back! ;)

Thanks,
I'm working on connecting to my Mac Powerbook with Sting, and then
I'll see where I go from there. I haven't found any information for
setting up the Mac end, so I'm having to experiment.

I simply don't understand this...:

1. Ben Smith's posts are cleary marked as ads, and very easy to filter
out if you don't want to recieve them.

2. He uses a real return mail addres so any complaints can be sent to him
direct. As he actually has stated that he does not read this group
regulary a followup to the group is simply stupid.

The only logical conclusion is that these people (Clockmeister, Mark D,
smeg, etc..) tries to form a mob against Ben Smith among the readers of
the group.

This behaviour is against all usenet netiquette and a far more serious
violation compared to posting any amount of ads. I personally find it
disgusting to watch and would like to meet any of you in person to take
proper actions!!

Hi Edward,

Are you saying that Falcon/030 (or is it 040?) will run MOST - say 90% - of the ST games, correct?

I thought Falcon will have "problem" running any ST games due to clock differences. And also I thought that - to get around to that problem - one needs a "clock" degrader to slow down the clock of the Falcon to match up the speed of the ST 8 mhz. Am I correct?

Does the Falcon have an internal floppy disk drive and internal HD simulataneously?

Otherwise, MegaST4 is my only ST-compatible to run ST games on the living room floor connecting a big TV screen. :o)

Now, it has been about a month ago that I last post this question "Using Atari Classic CX-40 joystick for PC?".

Does anyone of you were able to make the CX40 joystick (9-pins) compatible to PC's serial port yet?

(I don't see 15-pins port - just the 9-pins serial port here on back of PC. The other 15-pins are just for monitor.)

I want to buy it. $$$ will go to the creator's solutions. I dont know how to make one and I really WANT to use my timeless, die-hard joystick because I am good at playing games with it.

"Simple writing job"? (read earlier posting) How is that done?

Source record: 25659

I have questions, similiar to earlier postings here:

I have some .ST image files already BURNED on a CDR disc on a PC.

How do I convert it to a "regular" Atari disk format on PC's floppy A: drive?
(possible?)

So, that way, converting .ST image file from this CDR disc to the PC's floppy
disk (as "Atari format" disk).

Then, I would take that PC disk out and put in the STe to play games.

Will that work? If not, I need instructions.

Mike

>testing before you jump into broadband. I found the DaynaPort to be
>unstable and STing far to complex to setup correctly in a LAN.

I actually tried to help a guy to setup STinG with a DaynaPorton his
Falcon yesterday at the Nordic Atari Show but did not make it work. The
STinG kernel reported that the .STX could not find the DaynaPort.
Unfortunately this guy showed up when we were about to close so I did not
have time investigate any further.

>I dinked around with the route.tab file for some hours and never got
>outside my LAN onto the internet. It should not be that hard.

Hm the STinG routing table is extremly simple. For Ethernet you only need
a single line with:

0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

If the default gateway is 192.168.0.1 . Add to that a route to another
subnet (192.168.4.0/24) that can be reached from 192.168.0.7 and you get:

192.168.4.0 255.255.255.0 EtherNet 192.168.0.7
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

And if you also have a subnet attached to your own MIDI port:

192.168.3.0 255.255.255.224 Midi 0.0.0.0
192.168.4.0 255.255.255.0 EtherNet 192.168.0.7
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

Then simply enter the IP-addresses in STinG Ports Setup and you are ready
to go. Takes a few minutes and all done with a graphic gui except the
routing table itself.

These routes were actually in use at the show yesterday with great
success. The only bad thing was that we never got any of the computers on
the subnets to receive packets from the Internet outside of the NAT
router. I did put in the proper routes in the NAT-box but no luck
(possibly a bug in the box).

Last year we used a Linux box for NAT and had no problems.

I tried to solve this by using the STinG built in NAT (Masquerade module) but could not find out if this is possible. It seems that STinG is only capable of using NAT if you are connected via serial port through a standard modem and does not understand Ethernet?

>Anyway, you might need a router, Atari's don't deal with dynamic
>IP's so well, and a router can solve this. A static IP is preferable
>and a lot easier to setup.

I'd say a a NAT router is a must for broadband and Atari. You will have at least another computer for streaming media, ActiveX or whatever so you will need a switch and NAT (if you only get one public IP, dynamic or static). A Netgear, DLink, etc will do this for you and also provide some firewall functions to keep the nasty guys out.

>> very short sighted.

>Hmm, I don't think I've said that so extremely. I only said MiNT-net is
>the Standard TCP/IP stack, which it is as Iconnect is strictly speaking

That simply is wrong. I just talked to Erik Hï¿½ll yesterday about
implementing spam filters in his MyMail. The only problem he has got is
that _GlueSTiK_ does not implement a _STinG_ (STiK?) call for reverse
resolving of numeric IP addresses.

Note that Erik is a MinTNET user himself on his Hades but because there
is no standard IP stack has problems with his program. As there are too
many STinG/STiK users he just can't make it a native MinTNET client.

This is a bad situation with more than one stack on the Atari but to deny
it's existence will not make it any better.

ST - original ST, like 520ST
STe - enhanced ST, mainly 4096 pallettes instead of 512. (like the later STE version thereafter).

STf - what's that? "F"loppy drive internal?
STfm - now what's that? "FM" modulation, with TV video outport?

Strangely, my original 520ST did have video output (composite signal) for regular TV - but it looks terrible. Thats why it is bettter to use RGB monitor.

Now what does ST "fm" and "f" stands for again?

4484. Trying to read old ST disk on PC's drive

Newsgroup: comp.sys.atari.st
Date: 2003-07-07 21:05:47 UTC
From: mstepansky@aol.com
Message-ID: <20030707170547.19846.00000244@mb-m18.aol.com>
Source record: 25666

Lost and Found!

I found a dusty box full of numerous DS/DD (320KB?) and SS/DD (720KB) floppy diskettes from my college days. :o)

I dusted them off and then took one disk, for example, ".TNY graphics files". I put it in PC's 3.5" floppy disk drive. I got a partially garbled, gibberish files directorys displayed on my screen (ie. &^#*mikeys0, #$heyme$*#) but I can read some of the files directory as cleared as "lady.tny", "corvette.tny", "juggle.spc".

Some are Spectrum format files, TNY format files, and .NEOchrome file format. I remember most of the diskettes might have been formatted with higher tracks than normal using non-standard ST formatter.

By the way, I use "Gemulator.exe" to be able to read non-DOS disk (such as ST disk) in PC drive. I need another solution.

Questions:

1) Using this old ST disk in the PC floppy drive, is there a way for me to copy it off to PC's HD so I can use graphics converter on a PC to display the graphics? Is there such "actual ST-disk" drive emulator for PC?

2) Is there such SPECTRUM, NEO, Tiny, Degas, etc. graphics viewer for PC?

DSL would be out unless you have a router, to my knowledge no internet stack on the platform supports the pppoe protocol. Cable might be tough also without a router. I have a linux box running as a router on my lan using the Dayna scsi ethernet adaptor on my TT030.

I've tried the Sting Dayna drivers, like LP I was never able to get out of my LAN.. until I installed a Proxy server on my linux box. It was very stable, but I was only able to surf the web. I wasn't able to use AtarIRC or AtarICQ.

I've also been lucky enough to test the Stik 2 version of the drivers, the Stik version allowed me to surf the web without a proxy. AtariICQ and HighWire worked great with the Stik version also! BUT.. the only problem is the drivers still unstable. The system would freeze.

You might want to try the etherNEC LP mentioned, but you will still need a router in my opinion.

Kenneth,
I could not agree with you more on that issue. We definetly DO NOT need more TCP/IP stacks for the atari platform. What we need is a program that brings ALL of these TCP/IP stacks together under one client which is what MagicNet is capable of doing. Now I am unsure if MagicNet can be used under MintNet to use STING and Iconnect and Draconis clients. But it does work under Magic and Jinnee for sure as I use both STING and Iconnect clients on a daily basis. As stated earlier it would be nice if MintNet users did have a bridge for there OS so that they can use other clients as well.

Just my two cents,

Thanks,

Landover Amiga BBS is in the process of swapping to a web based system.
What's this got to do with ST's ?

Well, back in the 80's & 90's, Landover had a fairly active ST area.
Although no longer actively supported (at this point), I've restored my old
Atari filebase (around 300mb) & made it available, although mostly older
stuff, it may be of use to someone :-) And if interest warrants it, I'll
probably re-develop the areas again.

Anyway, Landover's on http://commodore.thebbs.org - help yourselves :-)

Glad you mentioned that, anyone thinking of getting a DaynaPort should
be aware that it requires bus arbitration or the system doesn't see it.

Hi Rodolphe,

Cable is good because I used it on my other falc. There is 5V both on pin 41 and 42. I have looked for evidence of burnt traces (in between layers I guess), but I cant see any, though it looks like someone replaced R43 before, there are burnt varnish marks around the resistor, and it hasnt been soldered very well, but it does measure about 4K.

Im going to have to get the circuit diagrams out, and trace the lines to the combel I think.

Regards,
Smeg.

Joe,

I use the solution from http://hardware.atari.org/ to connect my STE to the net using DSL. You can find details of my setup at

http://www.dwade.freeserve.co.uk/atari/main.html

You should be able to do the same things with the DynaPort card, but may need to modify some of the entries. Basically the main challenge is that you can't use DHCP to automatically configure an Atari adaptor, you have to set it up manually. However once this is done there should be no problems.

Dave.

If John would care to make an English version of this game (if it doesn't
have a resource file) he might find RGF's "eed" utility very helpful to
extract text strings from the binary - translate them and use the same
utility to place the translated text back into the binary.

I do have the pinouts for the monitor (still have all the docs I got
with my first ST ;)). But from what I can tell (from a search on the
net) is that it only has RGB and sync on the connector.

Where can I find DoitF030 on the web? Google?

I have been able to connect with an analogue modem using my MAC as a
gateway (IPNetRouter software). I can browse the web (much faster
than with the 28,800 modem attached to my Falcon), but Newsie and
Mymail lock up (CAB did occasionally too). AFTP works, but it
choked in 256 colors. Two colors worked fine. At least it is
working, but I'm not sure if I feel confident about trying a cable or
DSL modem.

Take a PIC processor and write for it a program that will read the Atari's simple button interface and convert to serial - send that out to your PC's port.

> I want to buy it. $$$ will go to the creator's solutions. I dont know how to

I'll charge you a mere 5 UKP for that information ;-)

> make one and I really WANT to use my timeless, die-hard joystick because I am
> good at playing games with it.

Sure.

> "Simple writing job"? (read earlier posting) How is that done?

You need a hardware interface, and the PIC is suited for this sort of job.
You will need to find the protocol for your PC's game port.

Hi, Ulf!

I'm not sure if I understood you correctly:

Your "new" 520STe has problems with the floppy. Clear.

UA> If I leave a disk on boot up it fails to boot and says error with
UA> disk.

So you switch your STe on with a floppy disc in the floppy?

UA> If I boot and try to read disk it says error with disk or no disk in
UA> drive.

You switch your STe on without a disc in the floppy (which takes longer
than with floppy btw.) and when the STe has booted up, then you enter a
disc into your floppy - which is not recognized properly?

UA> If I try to format a disk it seems to go through the format process
UA> little bar moves all the way across the screen but on verifying format
UA> it gives error with disk or no disk in drive.

Clear

UA> I tried replacing the drive with a pc high density one (modified like
UA> sony_144.zip). This didn't work either. Same errors recieved.

Did you check the connectors and cables? They might be faulty.

Maybe your floppy disc controller IC is damaged - best way to check this
is to replace it with a "borrowed" one from another ST, but this becomes
difficult if it has no socket.

There is a faint chance that your DMA controller is damaged, but I'd check
the floppy controller first. (It's the WD1772)

Good Luck!

Alexander

Hi, John!

JG> Can anyone say why my king runs out of people even though it looks
JG> like I'm winning the battle? (if I translated right)

Well, you're running out of people if you set too high taxes...

And now for the names:

Tölpel

Someone who is known for not being very clever in many circumstances. I found these translations: booby, dolt, galoot

Brubbel

Sounds childish, has no clear meaning.

Wusel

German "wuseln" is to incompletely do unnecessary things in inconsequent order (in this context)

Brösel

Associates with small, weak and anxious

Toffel

probably short for "Stoffel" - found "boor" as translation. Someone who did/said something not very intelligent, but without bad consequences. Not his reputation.

Rüpel

Someone who does not behave very civilized to archieve her goals, reckless. Found "lout" as translation.

Regards,

Alexander

Smeg,

If all else fails with getting the internals of the Falcon working
because it has a glitch or whatever,
couldn't you just resort to an external SCSI 2 HD (something like
,2-4gigs in a nice case)
Probably wouldn't have a problem getting all what is needed for
roughly around $40 on eBay.

Just an idea if in the case your M.B. ide is fried on your Falcon.
.... bummer if so...
but, there's always other ways right?

Hi Martin,

Long time, no see...

>Hmm, you still refuse to see the truth it seems. MiNT-net is indeed the
>only Universial Stack on Atari. IIRC Iconnect is not a stack at all so ...
>It's about time you face the fact Magic is a dead end. It's only because a
>kind Greec soul who make networking possible by means of magicnet (would
>this be possible without MiNT-net?)

Hmm, I'll try not to upset anyone...
I presume you know what "universal" means? If you do, then surely there's no
way you can call MiNT-Net the universal Atari stack...

>magic is still around here and there.
>The future is FreeMiNT with or without Aranym.

We've had this discussion before and it's obvious we both have a different
vision, to say that MagiC is still around "here and there" is like projecting
your dreams into reality, I put it to you that the largest group of Atarians
is still using MagiC. Not that it's of any importance really, MS Windows has
the largest market share while being the biggest crap...

>And if you like it or not the day you will use one of another Unix variant
>is coming nearer and nearer.

Anodyne has ported Mkisofs some time ago and proved that it is possible to
make a user friendly program that originates from the "other side". However,
they are the exception. Almost 99% of the so-called ported software needs a
big overhaul, you may feel happy using that crap, but I don't. Now, If it was
only me, you could say "who cares", but it must be obvious by now that there
are a lot more people out there who share my vision. You can deny this and
call all these people ignorant and dumb like our good friend Frederic Fouchet
once did, but that won't do, to make them switch...

>>AFAIK the developement of programs for MacOS 9 or earlier is nihil.
>>Everyone programs under MacOS X nowadays and suprisently lots of new stuff
>>is coming from the world you regard as an evil world.

When have I ever said it's an evil world? What I did say was that the "ports"
are crap, and I **do not** retract a word of it...
As for MaxOS X, does it surprise you to hear that I don't use it? Sure, I've
installed it, tried it, and then I trashed it :-)
Take a look at http://www.versiontracker.com to see how nihil the development

of OS9 apps really is.... when it comes to creating marketing hype, Apple doesn't have to learn lessons, IMO they're masters at it. There are more or less 25 million Mac users, according to Apple there are now 6 million OS-X users, in my book that's less then 25%. A softwarehouse or developer who's stupid enough to ignore those 18 million "stubbern" OS9 users needs his head examined.

>> For what its worth: my newsreader which is *not* a mintnet client *never*
>> slips ups, unlike yours obviously does. When someone is in my killfile, he
>> remains there....
>
>Not always true. People can change e-mail addresses very easily noadays.

True, but I haven't changed my address in at least three years. Let's say that the above quote was to tease Lonny. He publicly announced that he has put me in his killfile (obviously he doesn't seem to like the right to free speech, different opinions and visions), but whenever it suits him he replies to my posts, in my book that's hypocritical.

Cheers from Belgium
Dennis

>> very short sighted.
>
>Not very short sighted, its simply the truth. Unless Magic author release
>his brainchild as freeware, Magic is dead. Tell me who wants to buy a dead
>OS. I surely not.

Hmm, when is a OS truly dead? Following your logic it's dead when development is halted... I haven't seen a official statement so far from neither ASH nor from the author declaring it's dead. You assume it's dead, but that ofcourse could turn out to be wishfull thinking... but for the sake of this discussion let's assume that it's truly dead, so what? Me and a number of other people enjoy using it. Once it's installed and properly configured, one never has to bother and/or even look at it again. Knowing that it's running and doing its thing is all I care about really. Except for some MiNT-specific stuff which doesn't run under TOS either I can run everything you run, not bad for an OS which is declared dead by a bunch of people, hey ?
TOS died some 10 years ago, so what? Except for multitasking specific apps it will run almost all our software. IMO a OS is dead when there's no one out there using it anymore, and that won't happen overnight.

>I prefer a OS which is constantly under construction and which opens a
>window to lots of exiting things once we'll have fast machines which runs
>natively Freemint.

"once we'll have fast machines".... don't tell me you are in the same corner as Jared Falvo and all of a sudden are a "believer" also !!! The Milan040 was the last clone, and we all know the reason why it failed... only a very small portion of the Atari users spend money on hardware, the biggest group however doesn't want to and probably never will. It's always been like that and it is also one of the many reasons Atari went down....
And yes, I prefer using a OS which is still being developed also, how could anyone possibly not agree? The author of MagiC is working hard on MagiC X, let us assume for a moment that development for the Atari version has not come to an end, then I'm 100% convinced that the next version will benefit from the development of the OS X version, and that is a good thing... right?

>I've MagicMac/Jinnee. On the 300 MHz G3 it's fast indeed, even faster then
>my Hades but I must say I really don't like it. In my eyes
>it's an OS without a soul. It give me a feeling of the OS is telling me
>what to do. With MiNT (with or without MiNT-net) I have the opposite

>feeling. I'm telling the OS what to do. I'm the boss not the OS.

Oh boy....
The reason why you don't like MagiC is exactly the same reason why I don't like MiNT. Whenever I run MiNT I have the impression that I spend more time fiddling with the OS then actually doing something usefull. We both seem to have a different perception about working with an OS. I like using an OS which does whatever it's supposed to do and let me get on with whatever it is I wanna do, while you on the other hand like to control the OS and know exactly what it's doing...

>I only said MiNT-net is the Standard TCP/IP stack, which it is as Iconnect
>is strictly speaking not a TCP/IP stack. The development of Magic seems to
>be halted, which can't be said of MiNT, XaAES, Terra ...

.... If Iconnect is not a stack, then what on earth is it? And how do I manage to get online without using a stack? But let's not argue about it, I'm convinced that someone else will <grin>.
I never said that Iconnect is the standard stack on Atari, there are simply not enough people using it... STiK/STiNG is the most widely used stack on this platform, it's also the only one which can run on *all* the OS's, so if a stack deserves to be called the standard I presume that's the one... Don't interprete this the wrong way: I'm not saying that STiK/STiNG is the best stack on this platform, but then something doesn't have to be superior to be a standard.... Betamax vs VHS, USB vs Firewire, MS vs Apple or MagiC vs MiNT are shiny examples. When the majority prefers or is forced to use a certain brand, system or whatever it automatically becomes a standard...

>> love Magic and Jinnee because of its extreme flexibility. I guess this is
>> just one of those debates that will go on till the end of time.
>
>Indeed once in a while such debates comes up and dies out. It's always
>better then those Benny debates from that anonymous brainless guy.

This reminds me of the "good times", I know some people here hated the so-called OS wars, but compared to the posts I've been downloading the last couple of months, I would say, give me a OS-war tomorrow :-)
Anything is better then this!! Most of the posts in the OS-thread contained at least a couple of lines with info, now I have to be content reading stuff about a guy who doesn't trust his wife and thinks he's the recarnation of a Wolf!! Talking about being on topic in a Atari newsgroup...

About Ben Smith.... I always objected to his spam in this newsgroup, whatever is happening now, IMO he had it coming ...
IIRC then the anonymous poster made it very clear that he would stop posting when the weekly spam stops. So it's very simple really, Ben stops posting his weekly rubbish here, the anonymous poster stops posting also.... it's a win - win situation for everyone...

>Ok, I'll close my mouth now. I've said what I had to say.

Oh, but I haven't
In fact, I can go on for hours on end :-)

You wrote:
>I prefer a OS which is constantly under construction and which opens a window
>to lots of exiting things

This little sentence should be good enough to have a discussion that lasts at least the whole summer long :-)

Let's take MiNT as an example... I always have to read that it's still under development. I would expect from such an OS that new versions come with stuff that sets it apart from the competition (MagiC), two years have passed since the last update of MagiC, in that time MiNT has been upgraded twice. You'll probably say that I'm biased but what on earth have the MiNT-developers been doing? AFAIK nothing significant has been added to it...
IMO a modern OS should come with drivers, drivers for USB, ethernet, graphics etc... this has two advantages: the drivers will automatically be the standard to follow and the programmers don't have to reinvent the wheel. This thread originally was about a USB driver for this platform, since both MiNT nor MagiC support USB natively, individual programmers have to cater for it... and the same applies to stuff like ethernet, graphic cards or even a hard disk driver, our OS's don't support them, so programmers developed custom drivers, and we the users now have a choice between a multitude of incompatible drivers. Surely, this is a situation which is not recommendable...
MiNT may have a window to lots of exiting things, but until now, that window has been kept firmly shut by the developers. It's about time they open it...

Well Martin, if the above isn't good enough to spark of a lot of posts and start at least a little war, then I'll come back next week and use some stronger words :-)
"Trolling" is the correct expression IIRC....

CU

You are absolutely correct, this isnt my main falcon, so I could just accelerate the shit out of it, and use it for Cubase audio, I can still use my main falcon with Audiotracker, which needs the IDE if im not mistaken. I use a 1GB JAZ disk on my falcon for Cubase Audio, I could just move this over to the other falc, then put it in the studio, and connect both computers via the SCSI so I can transfer files between the two.

The only problem is, being an electronics engineer and a computer genius :P I couldnt just let this one go, I would have to repair it even if I have to buy another Combel from someone like Best Electronics (Anyone in Europe that has a spare COMBEL, let me know OK!?!?!).

Smeg.

Hi Derryck,
I don't feel too confident translating languages I'm not familier with
(meaning all of them) since I only speek US English and I'm still working
on that! :)
However, the RGF utility sounds interesting. Where can it be found?

4.04 fixes a serious bug -- 4.02 can write past the end of a partition
into the directory of the next partition! If you have 4.02, never
fill a partition 100%.

4.92 is a minor upgrade of 4.04, but is buggy from most accounts.

4518. Falcon I/O problems

Newsgroup: comp.sys.atari.st
Date: 2003-07-08 21:06:36 UTC
From: jdplace@prodigy.net
Message-ID: <wnGOa.12$Qg.57401@newssvr15.news.prodigy.com>
Source record: 25600

I posted some time ago about the SCSI problems I was having with my Falcon (hard disk locking when running any type of resolution enhancement software, i.e. Videlity, Screenblaster, etc.). It was suggested that I change my DMA buffer patch, which I did, but the problem continued. I did find that I could use Screenblaster in 2 or 16 colors without the problems. The problem mainly occurs in 256 colors. Now I have added an Ethernet (DaynaPort SCSI/Link T) to my Falcon, with my MAC as a Gateway to the internet. I am finding that some applications (AFTP, Newsie, Mymail) are locking up, like they can't handle all the data that is coming at them. AFTP will work fine in 2 colors, but locks in 256 colors. I'm sure it is unrelated, as the disk is not locking, but I am curious about it, and was wondering if any hardware wizzards here may have any ideas. Does this sound like a Falcon hardware problem in a specific component that I could replace?

LOTS of new articles and such over at TAT since the last update! Geez, I
don't even remember when that was! Stuff like:

* NEW (and FULL, not those dinky 3 or 4 line reviews like at
other sites) Lynx reviews from David Sherwin and Dan Loosen,
including Centipede, Loopz, Daemon's Gate, Lemmings, and more!

* More complete and in-depth 2600 reviews from star author
Ethan C. Nobles!

* New never before seen articles from the 2002 Year End Issue!

* New Interviews with Ian Chadwick and Greg Omi!

* Reviews of homebrew games like Qb and Space Instigators
with more on the way!

* Lynx programming contest, waiting for your entry!

* Coverage of new games from Sunmark including Rampage for
the Atari 8-bit line!

* Reviews for Atari ST, 8-bit, Jaguar, 2600, 5200, 7800 games!

Remember to check out TAT everyday! http://www.ataritimes.com

Are you getting screen corruption, especially when running higher colour depths, like 800x600 in 256 colours?

You probably have a bad memory card/simms. If you have old 30pin Simms then its highly likely.

Smeg.

Thanks for the links Steve (I actually found the docs on my own a
while back, but I appreciate the effort).

Anyway, I got it all figured out. I only needed to jumper the
"disable parity" option of the drive, and it now works like a charm
with both my Falcon and STE.

It was nice to see my STE alive with a hard drive again. It hasn't
had one since the mid nineties, shortly after I got my Falcon. The
STE's original drive ended up being connected to my Ensoniq EPS
(sampling keyboard).

But back then, before I took it's drive away, I made a backup of most
of the partitions, and eventually burned them to CD-ROM. Since
getting this new drive working, I copied all the partitions back to it
from my old backup, and once I booted the STE, it was like stepping
back in time 8 years or so, with everything as it was when I last used
it - my X-Boot configurations, Hotwire/Maxifile, Warp 9, View II, and
all the games and demos. Very cool!

My STE and I would like to thank everyone who offered their help!
;-)

They both work together fine now, since I jumpered the "disable
parity" option of the Seagate.

Thanks Derryck.

Now that my STE is back up and running with it's new hard drive, I'd like start adding to my ST game collection from all the sites that have ST "game images" for use in ST emulators.

Is there a utility (for PC or the ST/Falcon) that can take these game image files (usually ending in ".ST") and convert them back into useable ST native files or bootdisks?

Yes get STDISK for the PC among others. This will convert the ST format to DSDD disk! You may have to boot to a DOS boot disk to get images that are larger than 720k to copy to disk due to the DOS Emulation on Windows. Do a google for details on how to do it, I just talked about it a few months ago.

No screen corruption. Either the disk locks (light glows solid) or
the application I'm running locks. I do think I have the old 30 pin
simms though. I have a Wizztronics 14MB upgrade. I think they have
a newer one that uses 72 pin simms.

So what you saying are that by connecting just the sync signal on the
monitor to a composite output, it will work?
As I remember the guy that I got this monitor from tried to use it as
a composite colour monitor, but he never got it to work. I have an STF
as well, and an Philips monocrome monitor with composite sync, and for
that one I had to build a simple circuit in order to get composite sync.
Consist of just a couple of resistors, as I recall.

Anyway, I'll try this and report back later.

/Jocke

4536. PSU for CT60

Newsgroup: comp.sys.atari.st

From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3f0be4a6$0$4628$626a54ce@news.free.fr>
Source record: 25618

One guy recently asked me which type of PSU he could find to get inside the origin f30 case with the CT60.

The FLEX ATX norm is what we need !

It's a very small PSU that can be put between the CT60 and the rear border in the vertical position and you just need to cut a rectangular opening in the plastic cover to let a part of the PSU pass...

FLEX ATX is available in good PC shops like FLEX CASES....

I think the FLEX ATX PSU can offer enough space in the ATX TOWER to put the falcon mb in a medium ATX tower...
No need for a BIG TOWER...

Sorry guy's, you can't use the SC1224. It dosen't use comp sync. Only 7 pins are used. Audio, Red, green, blue, vertical sync, Horizontal sync, and ground. The SC1224, as with all ST montors do not use composite. You can have either but not both, i.e. RGB kill's composite and no ST monitor's were built to use it for that reason. Even the SC1435 (which was a philips CM8833/Commondore1084s in Atari clothing), had the chroma luma, and comp sync removed to save cost. I have been toying with the idea of fitting a commondore 1084s pcb into a SC1435 chassis just to have the Atari badge on my 800XL's monitor, tho.

Here is the answer from BEST :

Q. It's now 10 years for F030 and some NVRAM blocks have battery failure...

A. Yes, we do have the Atari Falcon MK48T87B clock Modules in stock.
Cost for the C398170 Falcon Clock Modules is U$D 11.95 each.

Regards

So all you have now is the 4 MD ST? I'm sure there are places that could
fix the Falconspeed.

Would find the mags interesting but live in Texas. Oh well.

Check out the Atari hangout chatroom sometime...

http://www.geocities.com/doctor_clu/JYBOLACFAQ.html

(That website will tell you all about the chatroom and how to get to it.)

Take care!

4540. Atari TT030 games that rock?

Newsgroup: comp.sys.atari.st
Date: 2003-07-09 11:28:08 UTC
From: Doctor Clu <drclu@swbell.net>
Message-ID: <BB316678.640A%drclu@swbell.net>

For you Atari TT030 owners, I imagine that you mostly use applications.
However, what games do you find work best on the TT030? (or work period.)
;)

So far I have seen and had fun with the latest version of Solitare by
Kent Cordes, Starball, Battle of Britian: their Finest Hour (Lucasfilm),
Civilization, and a few Asteriods versions. Other suggestions?

Well, then, how hard would it be to build a circuit that splits the
composite signal to RGB+Sync? How much would such a circuit cost?

Hi Rudolphe,
2 questions (please excuse my ignorance):

Why 2 numbers? Is one a stock # ?

Is there a more common clock used for other computers that is
currently in production that can be adapted in it's place?

John G.

4549. SM124 image adjustments

Newsgroup: comp.sys.atari.st

Hmmm, seems like a much too complicated circuit to build on your own.
I'm not that good on building or constructing. :(Oh, well, guess it
would just be cheaper trying to dig up some old Philips monitor or
buying a 14" TV new....

Thanks for the help though.

4553. Simple Falcon TOS question

Newsgroup: comp.sys.atari.st
Date: 2003-07-10 08:30:02 UTC
From: jamesdier@yahoo.co.uk
Message-ID: <8a14620.0307100030.7850ff7e@posting.google.com>
Source record: 25635

I currently have TOS4.01 in my falcon, i have a copy of TOS 4.04 as an image file. Can I use an old st bootsector loader (such as in UVK) to load the TOS.img file. I know there are many TOS loaders for ST machines but none seem to cater for TOS 4.xx.

I do NOT want to upgrade the ROMs - i have my reasons. So basically my question is - Is disk loading TOS4.04 possible on a falcon.

Thanks in advance

James

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmh@netzero.net for
more info.

Last updated 05-26-03

HARDWARE

Atari 520ST Computer System. Unit is upgraded to 1 Meg of RAM.
Unit comes with mouse, power supply, floppy drive, and manuals
all in the original boxes!
$50.00

Atari SC1224 Color Monitor.
$30.00

Atari SM124 Mono Monitor.
$30.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor
$250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$25.00

Syquest 44 Meg Cartridges. These will be Atari HDX formatted

with no bad sectors.
$10.00

Syquest EZ-135 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

Syquest EZ-230 Cartridges. These will be IBM DOS formatted with
with no bad sectors.
$10.00

SC 1224 monitor cover by Classic Covers. This is a brown cover
with the Fuji logo and underneath "Atari SC 1224 Color Monitor".
Perfect to protect your monitor from dust and have it look cool
too.
$5.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $10.00 each.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk
$5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk
$5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks.
$5.00

Decimal Dungeon by Unicorn Software. An education program for

5th graders to Junior High. Uses a variety of decimal related math problems to help you escape the evil dungeon and caves. Color or mono. Box, docs, disks.
$5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room castle in this huge adventure game. Comes on 5 floppies. Comes with box, docs, and disks $10.00

Little Computer People by Activision. There are really little people living inside your computer. And one of them is waiting for you to give him a home...and be his friend. Box, docs, disk
$5.00

Magical Math by Atari. The scholastic series math tutor program starring Bentley Bear. Box, Docs, Disk
$5.00

Mickey Mouse The Computer Game by Gremlin. Help Mickey rescue Merlin's Magic Wand in the enchanted Disney Castle.
Box, docs, disk.
$5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks.
$5.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in one and two player modes. Comes with box, docs, and disks
$5.00

Plan 9 From Outer Space by Gremlin. Complete with box, docs, and disks.
$5.00

Planetarium by Atari. The scholastic series observitory in your own house. One of the better if not best scholastic programs by Atari. Comes with box, docs, and disk.
$5.00

Quartet Gold by Red Rat Software. 4 games in this box, Pengy, Cosmos, Screaming Wings, The Secret of Steel. Pengo clone, Galaxian Clone, 1942 Clone, and a graphical adventure.
Box, docs, disks.
$5.00

Renegade by Mastertronic. A Star Raiders type space shooter type game. Manual and disk.
$4.00

S.D.I. by Mindscape. Complete with box, docs, and disks.
$5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

Their Finest Hour by LucasFilm Games. The Battle of Britain
flight sim. Box, docs, and disks.
$10.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks.
$15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk
$5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$30.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk.
$3.00

Geneva by Gribnif Software. A mulitasking operating system for
the ST/TT/Falcon. Now run more than one application at a time
and have up to 256 windows open at a time. Best thing is Geneva

is very fast and stable. Box, docs, disks.
$15.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk
$5.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
This is a boxed Atari version and not the pack in with the Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

PrintMaster Plus by Unison World. The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs
$5.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk
$3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk
$5.00

STraTOS2 CD. This is a CD Magazine covering the Atari line of
computers.
It is dated 1997 and is mostly in French but many of the programs are
in English. It covers and contains software for MINT, Linux, Games
including DOOM, Internet and more. It has a program that runs the
magazine
and gets you to the software for automatic installation
$10.00

Thunder by Batteries Included. Sophisticated writing tools including
spell checker, speed-typing word expander & corrector, and statistics
on your document like the number or words, lines and more.
Manual and disk
$5.00

Time Link by Batteries Included. A time management software package.
Keep track of appointments and see them by the day, week, month,
or year. Manual and disk.
$5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair

progarms that were infected. Manual and disk

It is indeed! If M$ really uses that address, they will be getting loads of spam by now which is funny because 90% of all spam is being brought into the world thanks to lame open-relay-by-default Microsoft Exchange servers. Maybe support can take a look at that. ;)

Draconis and Sting clients can run under MiNTnet without using Iconnect in between them. And I think that there was also an Iconnect bridge but I'm not sure because all Iconnect clients happen to be programs I try to stay away from. ;)

Apart from that, keep in mind that MiNTnet is also a standard in that it has a unix based network interface which makes porting internet software from other platforms easier. This is why MiNTnet had NFS and Samba before Sting did. :)

Funny, MiNT has gone through most of it's major developments while being dead according to your definition (from 1.12.4 on), and also got the largest userbase after "dying". Linux is also dead according to this definition, and has been from the start. Looking at its success, I'd say you're free to have your own definitions of a dead os but it doesn't look like a very useful definition.

> Oh yeah!, i just described MiNT

I forgot to mention one thing in my previous post: What do you think is more dead:

1. An OS released to GPL which has an active group of volunteers working on it (is any one of you anti-mint-flamers actually aware of recent developments or are you basing your opinions on a multitos disk you got with your Falcon?)

or:

2. An OS which can and may only be developped by one commercial company who seems to have no intention of doing so.

Personally I'd say Magic could only become less dead by becoming GPL'ed.

Maurits.

I sell it on eBay. Hope it's a correct forum for such an ad.

Link: http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3034555568

Here are the components of this Atari Mega ST4 system:

Atari Mega 4 ST (4MB memory) with internal floppy drive, keyboard and
mouse
Mobitor: Atari SM125 monochrome monitor
External floppy: Atari SF314 with power adaptor
External harddisk: Atari SH204 (20MB)

The hard drive contains a MiNT OS distribution (a UNIX flavor) with a
gcc compiler.
This computer was mostly used as an internet workstation (with external
modem),
and was connected to my Linux PC to form an internal subnet.

Because you use non RFC-compliant newsreader it looks fine for you but for those who use a good reader your messages are sometimes very hard to read. Drop Outlook Express in the dustbin (where it belongs) and get a good reader. You will do others and yourself a good favour.

DS1287A or DS12887 should also work, also compatible chips from benchmarq
and others (bq3287 etc.). You can often get them from old PC boards of
486 - 586 era.

>MC146818A
>MCCS146818BM

IIRC, these are register-compatible, but do not have the integrated
battery/crystal, so they will not work in the falcon.

Looking for programming app similiar to GFABasic on an ST...but is there one for PC? (win xp)

What would be a good "graphics power" BASIC programming language for today's PC?

Sorry if it sounds off-topics, but I am hoping ST programmers might have BASIC programming on both ST and PC. No time to learn C right now.

Mike

4566. Connect Mega ST4 to a Dell 17" monitor?

Newsgroup: comp.sys.atari.st
Date: 2003-07-10 20:44:41 UTC
From: mstepansky@aol.com
Message-ID: <20030710164441.29903.00000188@mb-m03.aol.com>
Source record: 25548

I am planning on getting a used MegaST4 over the ebay, hopefully.

Is it possible to hook up a MegaST4 to a Dell M782 (?) Flat-Trinitron, 17" monitor? Do I need special adapter? Where to buy?

It has a DB-15 serial adapter which go into the PC's nvidia card. I only want to play ST games on the MegaST4 to be displayable on this Dell monitor (low-res ST graphics mode) - and be able to hear sound somehow. I don't think this Dell has audio speaker internally. But...

I just found a dusty box "VideoKey" purchased in 1989. I only see regular ST RGB video output, composite video output with mono audio output, and RF tv output. There is no DB-15 output, obviously.

So, is there such VGA adapter that will connect between MegaST4 and this Dell monitor?

Thank you for answering to my question #2.

Now, I need someone to answer question #1.

Is it possible to insert ST disk in PC floppy drive and open it up and then copy them off to PC's HD?

I am getting a gibberish files/directories from ST disk when I open it up on ST drive, using GEMulator.exe (a non-PC disk reader). Why is that?

Any fix to it? I dont have a MegaST4 yet and in case I lost the bid in the ebay.com

Ah, that's should do. Thanks for your help. I will review past topics related to "Converting *.ST image disk into a real disk" as I printed them.

But still having problem the OTHER way around...

trying to read ST disk in a PC's drive...some gibberish and some legible filenames on the screen. I wonder why.

Is it because I format those ST disk "illegal" (non-standardly) rather than "720KB" format?

Is there a solution to that problem? It would be nice to get a better problem than gemulator.exe for a real-ST-disk emulation to read _any_ ST disk on a PC.

Source record: 25552

Matthias,

I just read your helpful instructions from
http://home.tu-clausthal.de/~ifmar/makedisk/

which stated:

"This one is for Makedisk to read a disk to image.

Insert the ST disk into the PC floppy drive. Type:

>makedisk /read diskname.st /auto

Makedisk should fireup and create a image file out of the disks"

So, therefore, this lead me to believe that there is NO WAY for me to open up ST disk in PC's floppy drive and select file(s) in Windows and copy them to HD. Right?

If so, then I guess "converting from real ST disk in PC floppy drive to an ST image" is the only way, right?

ok, Catch22 here...suppose I have:

ST disk#1 with Spectrum512
ST disk#2 has all kinds of graphic viewers applications for the ST.
ST disk#3 has the graphic files, tny, neo, spc, etc.

How will I be able to use all 3 (or more) disks into an single .ST image file, so I can run and view them in an ST emulator (STeem for PC)?

I will have to test out STeem to see if I can take one "load" .ST image disk on at a time and copy to the HD or another virtual disk (?) - not sure about that method or features in STeem.

But, I did test out an .st image file one at a time and it runs great in STeem - even in XP.

Mike

4571. Connecting MegaST4 to a larger TV projector?

Newsgroup: comp.sys.atari.st
Date: 2003-07-10 21:57:47 UTC
From: mstepansky@aol.com
Message-ID: <20030710175747.29903.00000198@mb-m03.aol.com>
Source record: 25554

So, it is unlikely to find such MegaST4fm - the little "m" for TV modulator output and "f" for internal floppy drive (which comes with it anyway).

Right?

If so, then VideoKey is probably the only way if anyone want to see ST games on a larger TV projector screen, and if ST doesn't come with "tv" output.

There is a version of gfa for most major windows flavors, 16bit versus 32bit windows, even a dos version, however it's my understanding the current gfa release, gfa-basic32 for windows chokes under XP, rendering it useless. Far as I know, no fix in sight either, appears to be dead.

Outside of that I cannot recommend anything for the PC as I only use gfa on the Atari. ;-)

Maybe somebody else has other suggestions...

Sorry - I posted too many questions. I will quiet down for a while.

Is there ftp site similiar to Genie's download ST library area? (is UnivMich the only site?)

Looking for some ST and Falcon (if any) demos to show the graphics capability of the ST, in terms of sounds and motions (ie. boink, fujiboinks, sphere animation, juggler are all I can remember in old days).

And of course, useful PD application - ie. astronomy, Eliza (talking psychologist), etc other explorative software.

Mike
Former ST user (1986-1992)

Hi Tony,
If your referring to a Falcon, first highlight the program then click
on "Install Application" from the drop down menu and go from there.

No not really, because news messages propagate thru the internet from one
news server to another. Thats why if you post a msg to your news server,
someone on the other side of the world may not see it for hours, or even
weeks if they use google :P

If someone who had access at the ISP to the news server deleted the message,
then you would be able to read it on another news server more than likely.

Smeg.

I don't think the DS1287 is still in production.
Seems that the DS12887 still is, but Dallas (now Maxim) mentions
compatibility issues on their websites.

> DS1287A or DS12887 should also work, also compatible chips from benchmarq

I wouldn't recommend getting a used chip to replace a used chip.

> >MC146818A
> >MCCS146818BM
>
> IIRC, these are register-compatible, but do not have the integrated

Some Falcons were built with MCCS146818BM, so it seems to work :-)
The 146818A does not have a battery and crystal.
However, these two are no longer in production.

From: JagCube@yahoo.com
Message-ID: <83fbea98.0307110451.5535e4e2@posting.google.com>
Source record: 25569

Well, going from the 1st message as original post....
You state using the DSP port for a USB.... how about make a cart that uses that NOT used
cart-slot that's always sitting there :) (unless of course you have a NIC card plugged into it)
Which in that case, I don't see why you couldn't get some sort of multi-cart bay or something and do both?!

Maybe that's a stupid idea, but? Just an idea regardless.
Also, does the cart not have access to CPU takeover and possible memory takeover as well?
I always thought it would be more ideal to have a new processor and maybe more ram (laptop ram?) in a cart and you could just plug it in the side of your Falcon (for us Original users!)
Hades and Milan would disagree, but there's always a solution that could be made for both
right?

Just my opS!

Message-ID: <3f0eb6d8$0$11569$626a54ce@news.free.fr>
Source record: 25570

Some of you (31) received their CT60 and I want to thank all ones that help
us to find some vicious bugs and debug....
With ABE 5E/F and SDR 5A last versions, I could consider that CT60 is now
really stable and ready to be shipped anywhere on any motherboard...
But the last motherboards I received let me see that some vicious things
happen some times in certain conditions and may crash the falcon...

So, I prefer to not yet start again shipping and past some few days to find
the real cause of this hazardous instability....I want a perfect product.
We are not far of that, but we are not !

Sorry for the new delay.

Some of you never send me infos about their CT60 !
I so consider all is running fine....but if not the case, they have to keep
in mind that ALL informations (I compare them) are good to help me to find
some explanations about the hardware problems I try to kill !

Regards

From: Lonny <lp060@coazter.com>
Date: Sun, 6 Jul 2003 11:12:13 -0500

>I still am willing to send ozk a pci usb card if someone could help
>me research the best one to go with, but it looks as if this is not the
>place for real discussions. I can see I need to move this to the Atari
>clone mailing list.

Since you're the self proclaimed USB expert and I am the moron I won't bother explaining that there is no such thing as the "best USB" card, as long as it's OHCI compatible (which 99.99 % of the cards are) ozk should be just fine. Ozk if you are reading this.... get in touch with me. I have a obsolete PCI-USB 1.1 card right here, you can have it. Lonny doesn't need to do any "research" at all and on top of that we save him from making a fool of himself in that mailing list. So it's clearly a win-win situation for everyone.

BTW Lonny: I have a clone gathering dust here, before you know it, I might bring it back to live and join that famous list. Kicking some life into it and having long, sensible and heated discussions with you.
Now, if that isn't something to look foreward to.... ;-)

>As Martin has said, magic is a closed door, and without a 3rd party
>hack it would be hopelessly lost.

Here we go again.... hopelessly lost at what? One single feature which me and a lot of other users do not use and need in the first place. Vasillis didn't want to reinvent the wheel, unlike some people. He simply "ported" MiNTNet improving it a little. You seem to forget that MiNT is hopelessly lost also without MiNTNet coming to the rescue.
Tell me, is MiNTNet an original from scratch developed application or just another port with some specific bells and whistles added? In my book your precious MiNTNet is a ported program. I've just learned that ported stuff is now being referred to as " a hack" here...
So here's the new definition of MagiCNet: it's an improved 3th party hack based on a 2nd party hack. You do realise that calling MagiCNet a 3th party hack doesn't do much justice to MiNTNet either I hope?

Vassilis or someone else for that matter could have reinvented the wheel and wrote a MiNTNet clone from scratch, he's done the sensible thing if you ask me and brought the two OS's a step closer. Let's put it this way: thanks to MagiCNet some people who would have turned their back on this platform, are still here, and in my book that's a good thing. You on the other hand aren't bothered by this ofcourse, these people are MagiC users, and we all know how you feel about people using MagiC don't we?

>I presented a perfectly legit idea, and rather than contribute any solid
>logical comments he'd rather call everything I say bullshit.

I call a horse a horse, and almost everything you "contributed" to that particular thread is bullshit... I suggest to read my contribution again, but this time unbiased and with an open mind. I presented a IMO perfect legit idea also, which you've dismissed purely on the basis that it came from me. But don't worry, I'll toss it up again sometime.

>Development should not focus on such an OS, that's simply a logical
>conclusion.

Logical? Sorry but I don't see any logic in that statement.
You want logic? Here's some logic to chew on:
If anyone out there ever succeeds at bringing USB to this platform he/she should do all he possibly can to ensure that the drivers work on all the OS's. USB on Atari should enable us to use mouses, scanners, printers and other goodies.... and I strongly believe that USB should be available for people using a 1040 under TOS as well. USB on Atari should *NOT* be OS specific to begin with. And don't come telling us that this is impossible. USB is coming to the Atari 8bit computers soon, is that ancient hardware superior to ours ?

>No OS is perfect, however since magic has been retro fitted to be mintnet
>compatible you can conclude only one thing. Development should start
>with mint and trickle the other direction. It's painfully obvious
>mintnet has set the standard for networking or magicnet would not exist.

I thought we were talking about a USB driver? I don't know what you have in mind but as the self proclaimed USB expert perhaps you could enlighten us a little? What on earth has MiNTNet got to do with USB ? And believe it or not but there are more people out there "networking" with STiNG then with your precious MiNTNet.
BTW: MagiC hasn't been retro fitted in any way. Someone developed a MiNTNet compatible hack for it, that's not quite the same thing is it?

>Seriously, what does Opera have to do with USB?
>Absolutely nothing, dennis just likes to avoid the real issues
>and cloud everything to the point where the original idea is lost.

Oh boy.... you take one sentence from my post, pull it completely out of context and then start nagging about it. Surely you can do better then that? Opera hasn't got anything to do with USB, just like MiNTNet hasn't got anything to do with USB...

Oh, and talking about clouding things: the original idea was to bring USB to the Atari platform, after you spoke your peace, the idea all of a sudden changed into bringing USB to a PCI based clone running under MiNT. And to sweeten it up a little, all the morons using a different OS and /or holding on to original Atari hardware could look forward to *perhaps* "someone" porting it over to their system....
Tell me Lonny, who's the real expert here in clouding things?

You know very well that there isn't a "someone" here that might "perhaps" port it over. I've been waiting for years to see the first non-commercial printer, scanner, CD-RW, graphic tablet, etc... driver appear ported by "someone"... why would it be any different with USB?

>The problem is people like dennis.

I made promotion !!!
I used to be just a pain in the ****, but all of a sudden I've moved on, I'm a problem now....
"people like dennis"... do you mean there are more like me in here? That's the most refreshing news I've heard in a long time !!

>Unlike dennis I do contribute back to the community, with software,
>mailing lists, docs, tips, see my website.

I propose we start up a Lonny P. foundation, if everyone chips in a couple of dollars, we might just have enough for a statue !!
But coming to think of it, we would have to start up a lot of foundations, erecting statues all over the place. I know at least a dozen people in this group who deserve a statue... In less then a year you're the second guy in here who tells me he's special.... don't trip over your ego Lonny.

You really must hate me, am I on some sort of 10 most wanted people list? You don't have the faintest clue about what I might do or not do for this platform but that doesn't stop you to feel superior? I'm not a programmer so my contributions are somewhat different to yours, let's put it this way: I know who and how I helped people out over the years, and they know it as well. The difference is that I don't come bragging about it in here. But if everyone I helped out would send me a dollar, I could erect a statue for myself :-)

But by all means keep on coding and contributing, you're doing very nice things, just learn to be a little more modest... I know people who don't participate in this group but do follow it. Some of these have done and still do more for this community then the two of us put together. These people who shall reamin anonymous deserve a statue, and sorry Lonny compared to them your contributions are peanuts, you're not in the same leage (yet), keep on trying...
Oh and the people regularly posting in CSAST are not the only remaining Atari users, they are just a *small* part of the Atari community. There are more or less 30 people on the atari clone list, some 1750 clones have been sold.... think and chew on this for a minute, where are these users and what is their preferred OS? Have you idea how many versions of MagiCHades and MagiCMilan were sold? Who these people are and what they use the clones for? These users aren't helped by your contributions at all, but they do value my input from time to time.... but don't worry, in here you're still mr.special.

>I fully expect dennis to go off, that is his prefered nature for I am
>evil cause I speak the truth.

You've made a study of my old postings, one thing you should have learned from these is that I'm fairly consistent...

Your so-called thruth stretches as far as your nose. Take a very deep breath and look around you. What I see depresses me deeply, and postings like yours who try to devide whatever there's left of this platform into good and evil are ridiculous. Forget the good old OS-wars, there aren't enough soldiers left to fight anymore. All what's left are a couple of generals, a few traitors, a dozen prisoners and one or two deserters.... like I said not enough to start a new war... sorry.

Cheers from Belgium
Dennis

It depends - if it's basically free, why not?

At least if you can socket the new chip, there is no risk in using a used one. If space is tight and you have to solder the new chip to the board, then I agree using a new one is better (and make sure you really get a recent chip and not one that has been on the shelve somewhere for several years ...).

>Mike

There is an adapter that will works, but you can only get mono on
the monitor. However, using the Video Key and a video converter,
you should be able to get a low color resolution just fine. I used
that method with my STe, a video converter, a Video Key and a
Compaq SVGA monitor.

I can do that easily using the Jinnee Desktop. There are programs
that will do this, but using Jinnee is better....

Yes, I get that same problem on my Hades under Magic. It started happening after the last upgrade and ROM has no idea what the problem is. I solve it by turning off the caches. Papyrus loads fine and after it does boot, I turn the caches back on. That, however, may not be your problem, but it is worth a try.

4603. Re: USB (was Re: DSP port on the Falcon)

Newsgroup: comp.sys.atari.st
Date: 2003-07-11 22:24:44 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1058029956-69487AEicMi@gmx.net>
Source record: 25499

From: Carey Christenson <falcon060@adelphia.net>
Date: Sat, 05 Jul 2003 23:29:54 GMT

Hi Carey,

>I would have to say that Dennis's idea of a SCSI to USB adapter would
>be quite doable and easily done by alot of our talented Atari
>enthusiasts.

It's a logical choice... that kind of adapter is for sale at this very moment. And it can be connected easily to every Atari ranging from the modest ST to the TT model, it can be connected to the Hades also, but the Milan users will have to fit a SCSI card, so they are the only ones who don't benefit from this solution. I propose the Adaptec SCSI ==> USB kit. The biggest advantage of this solution is that no additional ROMport to PCI interface needs to be developed, we all know how long it takes before a proposed development actually materializes on this platform, don't we ?

Another option which is worth thinking about is the printer port, there are adapters for this port readily available also, but these are even less popular...

>The only problem would be drivers for the tons of USB devices.

True, but these drivers will need to be written anyway, regardless of what kind of USB interface is used. As a matter of fact it doesn't make one cent difference how a USB device is connected to the computer for these drivers... those drivers are the so-called USB device drivers.

Explained very simply it comes down to this: the very first thing that needs to be developed is a OHCI compatible master driver, call it some sort of BIOS or even a library if you will. It's a software standard, that is very well documented and also adopted by Microsoft and Apple. And for once these two didn't screw it up, anyone calling himself a programmer and who's worth his salt should be able to port the sources and turn them into something workable for this platform.

The next thing that needs to be developed is the so called low level driver (that's the driver Lonny is on about), and that driver is the important factor in this discussion, it's the one that accesses the interface... so before one can start developing the driver he/she has to decide first what kind of USB interface is going to be used. I can understand Lonny his logic.... he has a computer with PCI interface, there are heaps of sources on internet regarding this subject and like he pointed out there's a open source driver available for the PCI-card interface waiting to be ported. So far, so good....

So why am I so against it? Let's say that I'm the realistic type and have quite a good idea of the state this platform is in. Well, forget all the hype and talk we've waded through the last couple of years and look at what has actually been developed. There's a group of people here that try to tell us that all the problems are going to be solved by open source software, MiNT is the gateway to all this beauty.... the truth however is somewhat different, because for some reason all that wonderfull stuff doesn't really make it onto this platform. MinTNet for example still hasn't got a DSL driver, although popoEthernet is very well documented and the open source lies there ready to be ported... that's just one example of things we're missing out on. Keeping this in mind it'll be a small miracle if that low level driver for PCI cards ever arrive onto this platform. We will need at leats a dozen miracles before someone stands up and develops a *second* low level driver that can talk to the interface used on the regular Atari hardware. Suppose Lonny wouldn't have a computer with a PCI-interface, do you think he would still be so much in favour to develop a driver for that one first? I think not....
He's a programmer, he knows very well what's involved to accomplish such a task, ask him what's going to happen if there doesn't stand up someone who's capable to bringing that task to a good end... it's not like this platform is flooded with talented programmers anymore, who writes some code when they get bored on a long hot summer night....

Lonny is right when he says that with the SCSI based adaptor there's a risk of data loss on the HD, but at least it's a universal adapter, and *if* it ever gets written then the whole community can benefit from it straight away. But let's see what he has to say about the printer port adaptor.... that one shouldn't cause problems on the HD.

Anyway, once that the low level driver is written, you'll have a USB bus connected that's recognised by the computer and ready to receive input/output. And then it's time for stage three, the development of USB specific drivers. You can't just attach a printer, scanner, CD-RW etc to the bus and expect them to work. I have no idea who is capable of providing these, but let's be optimistic, a miracle might happen after all.

One last thing....
PCI has been around for a very long time... ever wondered why nobody ever produced such an interface already? Ask NOVA why they stopped the production of their graphic cards when ATI switched to PCI. I recollect long threads about this subject in the German maus newsgroups... In a nutshell: it's virtually impossible, call it another miracle if that card ever makes it.
I'm not a religious inspired person, I don't believe in miracles.....

Cheers from Belgium
Dennis

You really are a fine piece of art Lonny. You haven't got the faintest idea of how to quote properly yourself, every single posting from you defies the RFC rules, and then you got the nerves to come in here and complain!!! And don't blame it on your precious newsreader, that would really make my day....

>I suspect dennis. rotfl!!!!

Sorry, it wasn't me :-(
In fact it was my brother in arms Steve. I've pointed out to Steve that he mixed up some facts and set the record straight concerning MiNT (see other post). You are a pityfull person Lonny, if you would put the same energy into programming as you do in trying to provoke me, this platform would benefit enormously.

>This is like the comedy channel, no wonder sinflap gets a kick
>reading this stuff. hehe

True, but then sinflap is an idiot who thinks this comedy channel is the only one available on his Dell computer. Nobody is forcing you to watch this channel, take your zapper and tune into:

From: Maurits van de Kamp <james.t.kirk@enterprise.nasa.gov>
Date: Thu, 10 Jul 2003 13:41:11 +0200

Hi Maurits,

>This is why MiNTnet had NFS and Samba before Sting did. :)

Yes
MiNTNet was ahead of it's time, it had superior drivers and some amazing clients when it was released, and then the music stopped all of a sudden. In 2003 one would expect that MinTNet would have evolved further but what has been improved and added to it the last couple of years?
You do know why STiNG was developed I presume?

>I'm not sure because all Iconnect clients happen to be programs I try to
>stay away from. ;)

You realise that CAB happens to be a Iconnect client I hope? I wish you lots of luck and fun with Draconis or the beta Highwire while surfing the web.

>Funny, MiNT has gone through most of it's major developments while being
>dead according to your definition (from 1.12.4 on), and also got the
>largest userbase after "dying". Linux is also dead according to this
>definition, and has been from the start. Looking at its success,

Success is very relative. What is the market share of Linux? You still wanna call it a success?
Oh and another thing: there's a big difference between having Linux installed on a computer and actually being a Linux user. Take me for example: I have a full blown MiNT installed on the TT, but I don't think anyone here would dare to call me a MiNT-user :-)

>I'd say you're free to have your own definitions of a dead os but it
>doesn't look like a very useful definition.

Indeed!! this ridiculous definition came about when someone took his dreams for thruth and declared MagiC dead. I'd say that a OS is truly dead when it's not used anymore. As long as there is a bunch of people using a OS it's alive and kicking.

>I forgot to mention one thing in my previous post: What do you think is
>more dead:
>
>1. An OS released to GPL which has an active group of volunteers working
>on it (is any one of you anti-mint-flamers actually aware of recent
>developments or are you basing your opinions on a multitos disk you got

>with your Falcon?)

Just like success is very relative, so is a group of volunteers. It's not the size of the group that is important but their input and knowledge. I put it to you that one talented programmer can achieve more in one single month then a group of volunteers in a whole year. At the risk of being flamed indefinitely here I'll make an even more bold statement:

****
After having to read here for years about all that wonderfull GPL stuff that would come to this platform warping us foreward I think it's about time someone asks the 10 million dollar question...
WHERE THE HELL IS IT? Why is it that a bunch of socalled selfproclaimed programmers after brainstorming for more then three years can't even manage to port a lousy scanner or cd-rw driver? Do you truly expect me to believe that all that hype is going to materialize on a blue monday? Sorry Maurits, I don't believe in dreamers dreaming up dreams for other dreamers....

Enjoy reading the specs of a certain GPL'ed source, that's about all you can do, the chances that that particular source ever becomes a usable application on this platform are nihil.
Shit, the more I think of it, the more angrier and upset I get.. This community has been split and teared apart by a group of people that publicly announced that we had to move on. I have always questioned their motives, and have been flamed for it many times. Well here we are at the point of no return: that group of nitwits is still making lots of noise and shoving a lot of hype down our throats. After almost three years I think it's quite safe to stand up and declare the following: *NONE* of those morons have the knowledge, capabilities and competence to bring the dreams they've been dreaming up here to a good end. And yes they have the right to defend themselves... but not with words anymore. The best way to defend themselves and make a fool of me is to release all that wonderfull stuff they've been promising for years on end. Am I really the only person in this group who questions all their bullshit? Are Atari users really just a bunch of dumb sheep dancing on the tunes some idiots with a distorted reality view are making?

****

Here you have it Maurits.... my personal view and opinion :-) Considering you are one of the 'believers" also I look foreward to the long list of GPL'ed stuff that has been ported over and is used by the majority of Atari users saying a thankfull prayer everyday. Oh, I'm even happy with a list of native Atari apps that now have the GPL status and which are under constant development, take QED for example, I can hardly believe my eyes seeing how the development of that application is moving on.... it's difficult to keep up with the never ending stream of updates, not to mention the overwhelming lot of new features is has now...
Wish it was true, alas the thruth is somewhat different. It's just as dead under GPL status as it was before. And I put it to you that's the case with almost all the apps that now carry that status. When will the majority of Atari users come to their senses and realise that GPL doesn't work for this

platform.
This is not the Linux platform, it would surprise me if there are more then 10.000 active Atari users left. Make a calculation and tell me, out of that number of users, statistically speaking what is the number of programmers we can expect. On almost every platform an estimated guess is 1 in 500. So statistically speaking we should be glad with 20 competent programmers. These 20 programmers are present, but where the hell do those odd other 150 come from? I have the impression that some people who can read a source file and know how to use a compiler "think" they can stick the label programmer on their heads as well... It's all fine by me, I don't judge someone by what he says, what he contributes is the standard, unfortunately all I see are words, nothing actually vapourizes, except for a lot more bullshit and even more promises. Sorry Maurits that's not good enough...

>2. An OS which can and may only be developped by one commercial company
>who seems to have no intention of doing so.

They're not in a hurry, why would they be? The competition is still playing catch up. None of the recent developments are earth shattering...

>Personally I'd say Magic could only become less dead by becoming GPL'ed.

You have the right to express your opinion, just like I have the right to disagree with it. So here's another bold statement :

You seem to think that MagiC is being developed by a commercial company who has a gang of fulltime programmers? The thruth is that MagiC is programmed by one man, ASH happens to commercialise the OS, nothing more nothing less. Think about what that single individual has achieved all on his own, now take your precious group of volunteers and compare.... imagine a group of volunteers who all have the abilities and competence of Andreas Kromke, then you would have the right to brag about it. As it is now, I put it to you that the developer of MagiC can, has and will achieve more on his own then a group of hundred of your volunteers.... and yes I'm willing to pay for Andreas Kromke his efforts. Paying for MagiC means I'm rewarding his efforts, he's about the last CAPABLE programmer left on this platform, and to me he's worth millions... the "other" side managed to get rid and/or scare of almost all the commercial programmers, and what good did it do us? Do you really think we moved on? I don't.... on the contrary.
Oh, one last thing: MagiC isn't dead, so don't look foreward to a funural, I would suggest to prepare yourself for a party. You and some others might get the surprise of your lives...

Let's hope nobody choked to death while reading this post, this community is small enough as it is. And to anyone out there thinking of replying, may I advise to read the post a couple of times and reflect on it? Is this a troll instegated post? Or is it a post from someone who's been shouting the same thing for years on end? Up until today hardly anyone wanted to listen, when will the shells finally fall from their eyes, when will the misleaded users finally come to their senses and realise they have little or nothing to expect from the "wonderboys".

To all MiNT-users who think I have a go at them, I honestly don't. I'm not targetting MiNT and MiNTNet at all, I'm targetting that group of losers in here who feel superior and think they are special. I'm sick to death of their bragging while they've got nothing to show for it. And rest assured, I'm not the only one with these views, but unfortunately I'm about the only one who can afford to express them in here.
I've been declared enemy number one in here a long time ago, I've tried to be reasonable for quite some time, but reasoning doesn't work ....it can't get any worser then this :-)

Cheers from Belgium
Dennis

4606. Looking for STE MOD File Player called "CDPLAYER.PRG"

Newsgroup: comp.sys.atari.st
Date: 2003-07-11 23:25:36 UTC
From: Paul Nurminen <visit_my_site@nurmix.com>
Message-ID: <3jhugvgcnu2fju0hj8p5gf3mpp28fgm84n@4ax.com>
Source record: 25584

Having recently gotten my my STE back up and running with a new hard drive, I decdied I wanted to listen to some of my old MOD files.

Well, looking through my old backup disks, I can't seem to locate a cool little MOD file player I used to use. I don't recall the name of the program, but the program's filename (deduced by looking at my old Hotwire menus) is "CDPLAYER.PRG".

Does anyone remember this, and if so, know where I might be able to find a copy?

Thanks!

No Falcon here. I got to see a beautiful Falcon once... C/Lab with Afterburner 040 and Nova card running Mint. Now that was nice. He had the Falcon hooked up a high speed network, so it was just awesome. I think I will always strive to build an Atari machine like that. ;)

But alas, the Falcon does not run Spectre GCR, so I went with the TT 030.

>
> Interested..... :)

I believe you always see the TT running in TT High, which, BTW, I have yet to see it in. As far as I know that required a special monitor, which of course I don't have.

No, actually the TT 030 runs in ST low, medium, and high, as well as TT low medium and high. ST-Medium makes for a great 16 color desktop with small icons! That is usually what my 030 runs in.

I use a typical SVGA monitor. So I take it you are a Falcon user?

You've answered your own question, in case you haven't already found out for yourself.

> Is there a solution to that problem? It would be nice to get a better

Format a disk under Windows and then copy your files onto this standard format disk.

There are other ways to transfer files from an Atari to another computer which will be faster if there are a few to do; look for PARCP on the web.

The ongoing saga of rebuilding a TT 030...

Managed to get from a friend for a good price a 4 meg TT-ram
daughterboard and a AlberTT 1.2 video card.

First off, TT-ram is awesome! I think it is funny how I "doubled my
ram!!" and only added... er.. 4 meg. :) But wow! So I wonder when the
TT-ram is actually used?
The 4-meg TT ram card is a fit of engineering that I will never
understand. Rather than simply making a daughterboard with simm slots, they
actually soddered FOUR - ONE MEG SIMS standing up. Strikes me as a dumb and
more difficult manuver personally. But I can see where sim slots could be
added later when I get really bored one day. Expand that puppy to 16 meg.

That is one thing I am enjoying about the TT 030... you can keep adding
upgrades to it. Amazes me.

And then this AlberTT card...

Who is the hell uses nine pin video connectors? Didn't that go out in
like 1986 or something? Here is this video card from 1991 that uses a nine
pin video connector. I have to admit, I didn't see that one coming. So now
I have it in my TT030, and have yet to try it out.

Once I find some nine pin to fifteen pin solution, of a REALLY old RGB
monitor, I'll let everyone know what I think of this. Heheh..

Take care everyone... oh, and check out the BBS ran on an Atari
computer through telnet... jybolac.homelinux.org 800

Hi Steve,

>> Due to poor quoting I am not sure who made this comment.
>> I suspect dennis. rotfl!!!!
>
>Due to your being brain dead you didnt realise it was me!, doh!, i
>think i can safely say that dennis does not accept your apology!

Spot on.... now how shall we punish that idiot? My first thoughts were
to send the troops in, but reflecting on the idea I dismissed it in
favour for a more suitable punishment. I think it's best if we send him
to the ASH reform bootcamp. Where he will receive a completely free full
MagiCal brainwash... once that he stopped rolling on the floor laughing
ofcourse.
After that brainwash hopefully he'll have learned that Outlook Express is
not an Iconnect client and in addition he also will have learned that ASH
Mailer always quotes correctly. It wouldn't even surprise me if they
teach him the proper way to quote according to the RFC rules, that's
something he hasn't grasped either so far. And they might even let him in
on a secret concerning a certain low level USB shared library that's in the
pipeline.

BTW Steve...
I was very surprised that you got away with your statement about MiNT,
it's incorrect. How does one call a piece of code that needs native TOS
to run and even uses some routines of it? An application, right? Oops I
just described MiNT...
MiNT is not just another day to day application ofcourse, technically
speaking I suppose we should call it a TOS-extension. Remember those long
threads about that other TOS-extension called NVDI? IIRC some of the most
"valued" members of this community went to great lengths explaining us that
a TOS extension is just a different word for dirty hack.
So here you have it: it's not a OS at all, but only a dirty hack. To be more
precise: an open source dirty hack. :-)

Cheers from Belgium
Dennis

>
>I and my "missus" live in the USA. You live in the UK.

So what? Steve happens to have mastered the art of time warping a long time ago. What it boils down to is this: he warps from the UK right into your living room, bangs your wife a couple of times , drinks a couple of your beers, gets payed and warps back. Because of the space time curve lap he arrives back before he actually left, so technically speaking he could be banging your wife indefinitely. And once that his PAK'd powered Atari has calculated how to circumvent the axioms of Euclidean geometry he should be able to time warp in the past. What on earth is so difficult to understand about it?

I think the least you can do is apologize to Steve.

Cheers from Belgium
Dennis

SO if its a TOS extension, and TOS is crap, then based on the weakest link
theory, MiNT is crap as its only as strong as the weakest link in the chain.

Dennis,
Long time NO hear from. Wondering what you been up to and such. I agree with you 100 percent the SCSI idea is probably the easiest solution for our platform. So I guess Lonny would have to go out and buy a SCSI card if he does not all ready have one in his HADES. And as stated before there may be a risk of DATA loss but if a good programmer made solid Low Level drivers for the cards they may be able to put precautionary code into the program that would protect ALL hard drives attached to the system INCLUDING IDE just in case it went that far. You dont have to explain the Magic and Jinnee thing. I think from what I have seen from Andreas K. is great so far and I think people who think this OS is DEAD will be sadly mistaken in due time. Dont pull out the kleenex tissues yet people. Keep in touch, are you recieving my e-mails OK???? I have recieved a few of yours but not since the end of MAY. Let me know what you want to do!!

Thanks,

The Hades has a SCSI on the motherboard as well as EIDE.
No cards required. Don't forget scsi tends to be more troublesome,
with bus arbitration, and termination issues.
Good luck with that path if you can find someone
to do it.

LP is indeed a valued member of this group. Lonny do some useful things
for the Atari community which you and thelikes can't say at all. Lots of
blabla but that's all you (and soul mates) have to offer to this group.
For heaven sakes, try at least to say something useful instead of the
mindless words you usualy spit out.

TTFN,
Martin

> could be made for both
> right?

Theres no problem with putting multiple memory mapped devices in the cart port, as long as they all use different addresses so they can all play nicely together. Also, they have to have very low power requirments or have a seperate power supply.

I wouldnt bother with using it for CPU or memory expansion though, as the cart port isnt a proper expansion bus, but rather a sub set of it. IIRC there is only 64K or 128K of address space there, I cant remember exactly but its not a lot, which makes it useless for that type of application. They are useful for (small) ROM cartridges though, or you could theoretically burn a different OS (a heavily modified TOS, or your own hash up ;-)) because TOS actually checks the cart port on boot up and can jump into code thats contained there, or you can put several progams on the cart that can be accessed from GEM as a virtual drive 'c' (lower case 'c').

An interesting hybrid would be to have a memory mapped USB chip here with an Eprom mapped into the cart address space which would contain the executable code to add new XBIOS routines for the USB host to whatever TOS version you were running. That would be an almost universal driver from a low level perspective. Then it would be a matter of some high level code that could run under magic/mint/multitos/singletos whatever to use the hardware thats actually plugged into the USB port.

Smeg.

Well I have seen hundreds of broken games that are not on a menu, some 1
filed, so it has been done... Actually I have seen only 2 versions of this
game and they have sprite problems so I am looking for a working one at this
point!

Thanks,
Tim

I had some usenet problems and ended up reading usenet with PINE via telnet on a friends sgi minus the normal filters. I must say the number of foul mouth posts from certain people was staggering. Needless to say I'm back to my usually reader. They think it is funny or such but in reality everyone I've ever discussed this with on IRC or ICQ thinks these people are complete losers. I guess if that is their goal to be interpreted that way, it is a forum perfect for that. They wouldn't last 5 minutes on an IRC channel or in a mailing-list. Anyway thanks for the kind words.

4633. CD-ROM & Atari TT with FreeMiNT

Newsgroup: comp.sys.atari.st
Date: 2003-07-13 04:24:11 UTC
From: rodsmith@nessus.rodsbooks.com
Message-ID: <btmqeb-gv3.ln@speaker.rodsbooks.com>
Source record: 25520

Hi,

I've recently spent a bit of time getting FreeMiNT (version 1.15.12) running on a TT030. I've also been trying to get a SCSI CD-ROM (a Sony CDU-76S) working on this system, but with little success. The system is currently using some ICD SCSI drivers, and the package includes a SCSI ID scanning tool that shows the CD-ROM drive on SCSI ID 1. (The ICD tools also show a "9" shadowed out for this, and based on the IDs reported for my hard disks when the system boots, I suspect this is what they're using for the CD-ROM drive.)

I've tried the only CD-ROM driver I can find for MiNT, something called CDROM.XFS version 0.7. The documentation is in German, and appears to say that the file should be placed in the root of the C: drive or in the C:\MULTITOS directory and renamed CDROMab.XFS, where a is the drive letter and b is the SCSI ID. I've tried naming the file both CDROMQ1.XFS and CDROMQ9.XFS (and lots of other things), but whenever I boot, it says the name is unacceptable and the drive doesn't show up under the chosen (or any other, as far as I can tell) drive letter.

I've never tried hard to get the CD-ROM working under single-tasking TOS, but I've tested it on another system, and it works OK there. Does anybody have any suggestions? Is there another driver I can try? (If so, where?) Would changing my underlying SCSI drivers help? (If so, what should I try, and where can I find it?)

Thanks for any pointers!

If you want to go sure about compatibility and have a PC and a
large color TV, then why don't you get WinSTon and play your
favorite games with your TV plugged to your PC graphics card?
There are roughly a dozen ST TOS versions and you can never
be sure that a certain TOS will support all your favorite games.
So get WinSTon and a couple of TOSes and make your PC rock
the goodies.

Try that first. You'll need Metados or Betados. If you have this working
make the next step to make it work with FreeMiNT.

You should get the SPIN package (http://www.muenster.de/~reschke/spin.html)

Maybe you also need another HD driver - HDDRIVER is the best.

That chip is only a USB node device, unless someone did some really neat tricks, it can not be used as a USB host controller (which you need if you want to attach mice, disks, etc.). If you want to attach the ST as a USB device to a PC which is used as the host, then that chip would be fine.

If you really want USB host support, better get a chip that is designed to be used as a USB host and that handles some of the tasks in hardware.

This is probably because PC's dont like anything other than 9 sectors, 80 tracks. Its touch and go whether you can format a disk larger than this on a PC. I use vgacopy 6.25 to do all my wierd formatting. Try it, it works like fastcopy pro, even looks similar and accesses the Floppy Drive controller directly.

Smeg.

That depends partly on what is running on the PC. If it has a separate DOS, it has a help file on how to imitate a different floppy format, for any disk format you can think of. Windows 95 will read anything, because Microslop had to follow their standard in order to do a floppy disk distribution of Windows 95, on 1.62 meg disks.

And it depends partly on what is running on the ST. If it is TOS 1.4, that writes a compatible boot sector on the disk. If you are not, there are programs which will do that.

That all being said, if eveything else is OK, Windows Explorer will read disks that the various applications will not, and call those applications. If there is a better explanation, I do not have it.

So yes, it is possible, depending one other things.

Jim

You have your own definition of programmer.
Some people writing a few html line are also considered programmers.
Irrelevant.

> >2. An OS which can and may only be developped by one commercial company
> >who seems to have no intention of doing so.
>
> They're not in a hurry, why would they be? The competition is still playing
> catch up. None of the recent developments are earth shattering...

hmmm beg your pardon?

Playing catch up?
You're kidding right?

where's the security in magic? where's the file locking capability?
Where's the multiuser experience? where's the memory protection?
Where's the remote display? where's everything?
Where's process prioritization?
I believe there's a lot of work still, and you have the balls to say "the
competition is still playing catch up".
Dang! ignorance, or mental retardation?

Thanks for your pointers. I've finally gotten it working. Much of the
problem I had was that all the documentation (for both the CDROM.XFS
driver I tried originally and the SPIN package you mention) is in German,
which I don't speak. A Babelfish translation helps, but leaves big gaping
holes. I finally tracked down a decent English translation of the SPIN
documentation, and that set me on the right path, in terms of what files
I needed installed where.

4655. Re: The good, the bad & ugly (was Re: USB)

Newsgroup: comp.sys.atari.st
Date: 2003-07-14 08:37:40 UTC
From: Maurits van de Kamp <james.t.kirk@enterprise.nasa.gov>
Message-ID: <betqbh$7u0$1@reader08.wxs.nl>
Source record: 25536

Hi Dennis,

Sorry your enourmously long rant was so full of stuff that didn't even remotely have anything to do with what I said that I can't be bothered to quote it all and reply to every detail that sparks a reaction in me, because I'd end up with a posting twice as long and I doubt anyone would read it. :)

Just a few points to clear out the biggest misunderstandings.

1. I am not denouncing Andreas Kromke for his great work on Magic and the fact that he wants money for it. I'm just saying that in a community as small as it is (as you rightfully point out), an os that is developed by volunteers has more of a chance than an os that needs commercial backing.

2. I'm not flaming you for using Magic. I'm getting tired myself of MiNT being portraied as a difficult-to-use silly knot of obscure software only used by freaks. It's clear that you haven't been watching for a while, which also answers your other question "what has been developped lately"? Well, the thing that mostly needed development in MiNT: Easy installment. RPM handling was a great step, and now with several easy bootstrappers around, installing and configuring MiNTos to a fullblown Unix setup is a breeze even for newbies. Sure development of MiNT itself is slow but we did move on a few versions. Has Magic been so busy developping? What new functionality has been added in recent years? As far as I can see, only stability improvements, something that MiNT+N.AES hardly needed in the first place.

Still, loads of smaller updates have taken place in the MiNT kernel, if you want to know what read the changelog, and if you want to keep up to date join the MiNT list.

3. Remember I left the Atari-NL mailinglist after a discussion like this with you? :) As you (and apparantly only you) know, I didn't leave because of the discussion itself (which I enjoyed because most of it was quite in-depth) but because other people of the list who were telling both of us that an Atari list shouldn't be about modern stuff, only about tos 1.00 issues and how to copy st games. So, I just wanted to add I'm glad we can talk about modern-day st use, and I still consider you a friend :)

Maurits.

> CAB is not a "Iconnect" client per se.
> CAB is a html browser/reader, with option to have plugin for connectivity.
> Happens to work with mintnet, iconnect, stik whatever.

Correct. In fact, CAB started as offline browser. The first network
layer it supported was STiK. Then came MiNTnet(!!), and iConnect was the
last layer it supported.

Apart from that, yes Dennis I'm staying away from CAB because it sucks
mammoths. In its bug/functionality-ratio it's even worse than Explorer
and Netscape, which is quite bad. So I use my Mac for browsing (Chimera).

Highwire is quite promising and actually still under active development.
It is incomplete, but everything that IS complete works way better than
CAB. Just a bit more development and I might start using it seriously.

Maurits.

I've tried them all and again, it is RapidQ Basic http://www.basicguru.com/
That's the best. It has very good modularity, it has access to all Windows DLLs
and it has libraries for easy DirectX and OpenGL programming!!

Of course, it also have support for TCP/IP sockets and it comes with good
documentation and over 150 examples.

Best of all, it is free!

Ok! RGF's EED program works nicely! I limited the extraction to a
minimum of 5 characters to get text strings so the file size is about 38k.
If I knew different languages I'd be having fun now but, as I said, I'm
stuck with only my US English! So, a volunteer is needed :)
Anyone interested in translating the extracted file that I will re-enter
into the BALLER2.APP can either E-mail me (address above is good) or post
here. Not sure about the DAT file yet.

Regards,
John G.

I have translated the original Baller.prg/Baller.rsc into English.
I used a hex editor for baller.prg and Interface 233 for baller.rsc.
If you like I can send you the prog.
baller2.app didn't work on my system so - no translation - sorry.

best regards
Jens

4668. Ballerburg Partially Translated

Newsgroup: comp.sys.atari.st
Date: 2003-07-15 09:20:50 UTC
From: swampfax1@atlantic.net
Message-ID: <SHPQa.20797$Ry3.2449326@monger.newsread.com>
Source record: 25450

Hi All,
I've succeeded in partially translating Ballerburg 2 with help
from Alexander (and Derryck's suggestion to use RGF's EED program).
There are still lines of text to be done that are out of my range to
translate so a German/English speaking volunteer is needed.
I thought it might be best to extract all the text strings instead of
using a minimum of 4 or 5 characters to make the resulting file smaller
but I can copy chunks with a text editor and send to any volunteer to
translate and then re-incorporate it back into the eed file for processing
if anyone cares to step up to the plate!

Later,
John G.

Hi,

>So far I have seen and had fun with the latest version of Solitare by
>Kent Cordes, Starball, Battle of Britian: their Finest Hour (Lucasfilm),
>Civilization, and a few Asteriods versions. Other suggestions?

Everything from Sierra Online (Larry, Police Quest, Kings Quest, Space Quest etc...) works just fine. And you shouldn't have any problems with anything coming from Lucasfilm either (Zak Mc Cracken, Indiana Jones, Monkey Island etc...).

>However, what games do you find work best on the TT030?

You'll be pleasantly surprised to see how many titles that actually run with no problems at all. Keep in mind that I'm talking about original software, a lot of the "cracked" software contains a splash screen or intro from the hackers, and that demo almost always causes the problems on a TT.

Cheers from Belgium
Dennis

Hi Frederic,

>>Success is very relative. What is the market share of Linux? You still
>>wanna call it a success?
>
>ouch, please check your numbers before talking about linux market share.

An estimated 7%.
And yes I realise that those 7% represent millions of users. I would not
want to feed them... but I certainly wouldn't want to feed those other 93%
ignorant people either.

>>Enjoy reading the specs of a certain GPL'ed source, that's about all you

>>can do, the chances that that particular source ever becomes a usable
>>application on this platform are nihil.
>
>hm did you check what extra apps are available on atari because of
>GPL/open src?
>few example:
>
>mp3 players
>gcc!
>POV
>doom
>perl
>samba
>ghostscript
>etc. (the list is indeed very long)

Here, we go again... from previous discussions you know very well what I
ment. Yet you always refer to same things. It's probably coincidence but
that list contains hardly anything which isn't already available for this
platform be it shareware, freeware or commercial ?

gcc! : are you gonna write the missing libs ? :-)
Mp3 players: yeah right, my TT just loves playing mp3's, AFAIK there's a
very good alternative available: Aniplayer.
POV: oh boy, this takes me back some years... I think it was ported before
both MagiC and MiNT existed... there are a couple of very good commercial
alternatives around.
Doom: I'm not into games anymore, and even if I was, I wouldn't really
call that example a Atari game. Just look at the hardware that's needed,

so like usual it's a port for the minority of the users.
perl: OK, I give you that one..., although I don't call that example
exactly something which will be used by the majority of people here.
samba: and that one as well :-)
ghostscript: AFAIK the development of ghostscript for Atari is dead. When
has it last been updated? *AND* it needs an update. Not that it matters
much really, Ultrascript is just as good and lots faster, but Ghostscript
is a good example that GPL isn't all you make it out to be. When no one
continues the development, it's as dead as software which doesn't carry
the GPL tag.

>You're kidding right?
>
>where's the security in magic? where's the file locking capability?
>Where's the multiuser experience? where's the memory protection?
>Where's the remote display? where's everything?
>Where's process prioritization?

No... I'm not kidding. I'm dead serious.

MagiC isn't ment to be used in a multi-users network. It's an Atari OS,
and the hardware concept doesn't allow networking without 3th parties
hacks. So keeping this in mind...

security: not needed on a one man, one computer system...
file locking: not needed at all
multi-user experience: I've answered that one already.
memory protection: it's missing and with a good reason. Memory protection
only works well with apps that were written with it in mind. Do I have to
list the endless list of apps that screw up memory protection? I could put
it differently and say: when an app is properly written it won't overwite
the other processes. With or without memory protection, a dirty written
program will always cause problems.
etc...

>I believe there's a lot of work still, and you have the balls to say "the
>competition is still playing catch up".

Oh yes, there is an enormous lot of work that still needs to be done, I
have a "wish list" here that's at least a mile long. But it does not
include the stuff which you seem to find important.

>Dang! ignorance, or mental retardation?

You've made your mind up a long time ago, remember?

Cheers from Belgium
Dennis

From: Maurits van de Kamp <james.t.kirk@enterprise.nasa.gov>
Date: Mon, 14 Jul 2003 10:42:59 +0200

Hi Maurits,

>> CAB is not a "Iconnect" client per se.
>> CAB is a html browser/reader, with option to have plugin for
>connectivity.
>> Happens to work with mintnet, iconnect, stik whatever.
>
>Correct. In fact, CAB started as offline browser. The first network
>layer it supported was STiK. Then came MiNTnet(!!), and iConnect was the
>last layer it supported.

True, I should have put a winking smile behind that statement. There are
people here who's stomach gets upset when the words ASH or Iconnect are
mentioned.

>Apart from that, yes Dennis I'm staying away from CAB because it sucks
>mammoths. In its bug/functionality-ratio it's even worse than Explorer
>and Netscape, which is quite bad. So I use my Mac for browsing (Chimera).

I agree, but CAB is the best from the rest of other awfull apps pretending
to be browsers. People who don't have anything else then a real Atari at
home have little choice. Don't forget that the development of CAB stopped
some odd five years ago, version 2.6, 2.7 and 2.8 consisted of additional
addons and improved iconnects, but the browser itself...
BTW: you should try out Safari... rumours have it that its a cute little
browser ;-), under OS 9.2.2 I think Opera is the best of the bunch, iCAB
just like on Atari doesn't quite cut it...

>Highwire is quite promising and actually still under active development.
>It is incomplete, but everything that IS complete works way better than
>CAB. Just a bit more development and I might start using it seriously.

I have to be very carefull and walk on eggshells now:
Since Highwire still carries the beta tag, it's not really fair to comment
on it. Not that there's a lot to comment on, I can only use it as a very
primitive offline browser since it's not an Iconnect client.

Cheers from Belgium

Source record: 25456

From: Doctor Clu <drclu@swbell.net>
Date: Sat, 12 Jul 2003 06:59:25 GMT

Hi,

>First off, TT-ram is awesome! I think it is funny how I "doubled my
>ram!!" and only added... er.. 4 meg. :) But wow! So I wonder when the
>TT-ram is actually used?

Whenever it's present and the applications are told to use it. You can do this by changing the file it's flag to run in TT-RAM and /or use the TT-Malloc (memory allocation). With desktop programs like Jinnee or Thing you can change the flags on the fly. But when using the standard desktop however you need to use a configuration program to set the flags (take a peep in your mailbox...)
Almost all applications programmed after 1992 can run in TT-RAM, but be carefull with auto program files. The HS Modem drivers for example *must* run in ST-RAM.

>The 4-meg TT ram card is a fit of engineering that I will never
>understand. Rather than simply making a daughterboard with simm slots,
>they actually soddered FOUR - ONE MEG SIMS standing up. Strikes me as a
>dumb and more difficult manuver personally. But I can see where sim slots
>could be added later when I get really bored one day. Expand that puppy to
>16 meg.

This may sound a bit harch, but don't waste time and money upgrading that card. Instead go hunting on the German eBay site. Look for a AiXit TT or even better a Magnum TT expansion card. These cards can take two 72pin SIMM's and are expandable to either 64Mb (AiXit card) or a whopping 256Mb (Magnum card). The typical bidding price for these cards is 40-60 dollars on the German ebay site, don't go hunting for them on the international eBay, because you'll never obtain one without paying minimum $250 !! The price of 72pin SIMMs these days isn't worth discussing... just visit a Mac newsgroup, they are offered for free in there ;-)
And please don't say that you'll never need more then 20Mb of memory... if you take Atari computing a little serious then before you know it, you'll want to run a full blown MagiC or MiNT setup. Regardless of which OS you opt to use, they both need *LOTS* of memory. My TT for example garbles up nearly 16Mb when it boots....

>Once I find some nine pin to fifteen pin solution,

Radio Shack or a similar store should be able to sell you a 9 to 15 pins adaptor for a couple of dollars. I wouldn't be surprised if someone here offers you a suitable cable... these cables were quite common in the early

90's and came bundled with the monitor. I could send you one over, but sending a common stupid monitor cable to the other side of the world seems a bit pointless from where I'm sitting. If you can't get hold of it, then get in touch...

>And then this AlberTT card...

I've heard of it, but never seen one in action. IIRC technically speaking it's not really a graphic card, but don't let that bother you. Getting rid of that annoying black border justifies using one... when the day comes that you want more (and it will come), go hunting on the German eBay site for a Nova graphic card with Mach 32 or Mach 64 engine. Do not believe any tales from people telling you that a Crazy Dots card or ET-4000 card is just as good, they're not. Furthermore Nova cards have a VDI that is optimized to run with NVDI, and they perform equally well under MagiC, MiNT and singleTOS

>That is one thing I am enjoying about the TT 030... you can keep adding
>upgrades to it. Amazes me.

YES!!
It's the most expandable computer Atari ever made. If you are really lucky then perhaps you might even get hold of a CaTTamaran processor upgrade. If you can locate one do the following: get a 68030/50Mhz processor, fit the CaTTamaran, hack it and let the whole sh-bang run at 66Mhz. The regular processor isn't stable at that speed and overheats, but the 50Mhz version runs flawless... anyway, you'll have a TT which runs twice as fast and when a Nova card is fitted will even outrun a standard Milan 040 (I speak from experience).

But before I drive you completely crazy, let us focus at what you can do with it right now: I used to have three printers connected to the TT, a dot matrix printer on a serial port, an inktjet on the centronics port and the SLM 804 on the DMA port. I know it's overkill, but when you got the options why not use them? The word processor Tempus Word Pro can control the three ports at once, meaning that you can print three documents at the same time on the three different printers, but that's a feature one usally only uses when a friend or relative drops by who happens to use a Mac or PC, success is *allways* guaranteed :-)
So that leaves us with three more serial ports, hook a modem to the Serial port 2, in my experience that's the most reliable for internet, next hook a graphic tablet and a good mouse in the two reamining free ports.

In the Romport you can shove a Spectre GCR cartridge and turn your TT into a very fast Macintosh classic, there are heaps of software for it on abandon-ware websites, OS 6.xx is freeware now and can be downloaded from the Apple website.

In the SCSI port you probably want to connect a CD-R and CD-RW, don't pay good money for these, just like the SIMMs, they are offered for free also in the Mac newsgroups :-)
No computer setup is complete without a scanner, the choices here are rather limited because of the lack of suitable drivers. The GDPS protocol turns the

tedious job which scanning is into fun... the best driver I've come across is the Epson GDPS_SC driver, it's shareware and beats the commercial drivers for the Mustek and HP printers handsdown. If you happen to have an Epson colour inkjet then you can turn the TT into a relatively fast colour copier with a little help from PhotoTip. All Epson scanners up until the model 1200 are suitable. You should be able to find a GTxxxx model for $25 or less....

If you have a digital camera then a smartcard SCSI reader is a must, they're quite affordable and transferring pics to and from the TT is much faster then with the slow serial ports.
According to Murphy's law disaster happens when you least expect it, so be prepared and have a Zip or SyQuest connected to the TT, a backup is never far away....
If I counted correctly there's only one SCSI ID left now, I like to have a spare one.... if someone pops in with a piece of hardware to test or play with, you I have to reconfigure the whole lot....

And last but not least we also have the DMA port to take care of: it's obvious that one should hang a SLM 605 on that port, if you're into boxes which can house a large dog then opt for the SLM 804. If you've got some spare hard disks left you can attach these also to the DMA port, or when using the Link2 interface you can attach some more SCSI based stuff. This machine is expandable beyond anyone's dreams... do you know a computer where up to 14 SCSI based devices can be connected without even opening up its case?

You can also attach a monochrome 19" Atari monitor to the TT, but these are getting old and worn out, repairing them is getting more difficult all the time not to mention the price... if you opt to use a Nova card then there's no need for that seperate 19" monitor. The Nova card can easily handle resolutions up to 1600*1200 in monochrome *AND* colour. Pay a little extra for a really good monitor, a Sony 19" for example will never let you down and the Trinitron tube guarantees a rock stable and very crisp display.

Oh and talking about never letting one down.... I have my TT 12 years now, because of a sticky hard disk I don't turn it off anymore, it's running approximately three years on end now. In those 12 years I've worn out two mices and a keyboard, but that's about it. The TT is build to withstand worldwar III :-)

I hope you have as much fun with your TT as I have had all these years, Falcon users will disagree, but IMO the TT was Atari's masterpiece.

Cheers from Belgium

4677. Atari Falcon for Sale&Bits

Newsgroup: comp.sys.atari.st
Date: 2003-07-15 13:50:59 UTC
From: shinanagons@yahoo.co.uk
Message-ID: <f237d271.0307150550.33fe9695@posting.google.com>
Source record: 25453

Hi,
The increasing cost of higher education unfortunately leads to the
following for sale;

Atari Falcon 4mb, 310HD perfect working order. Key clicks. VGA
adapter.

Cubase 3.1 & dongle

Atari SM124

Phillips Color monitor (stereo for STe / falcon)

Also ST Format magazines 1-the end

Games and piles of disks, including ST Format cover disks. Has anyone
thought about making a CD with all of these disks on?!

Offers please to

shinanagonsREMOVETHIS@yahoo.co.uk

many thanks
shinanagons

Date: Sat, 12 Jul 2003 19:49:29 GMT

Hi Carey,

>Keep in touch, are you recieving my e-mails OK????

Yep, about 10 so far, in both mailboxes.
I've mailed several replies and they didn't bounce back...

>Let me know what you want to do!!

Get another ISP, the one you've got now clearly hasn't got a clue what
he's doing. Once that "super computer" arrives, you'll need to change
anyway... Ask them if they lifted the filter on *incoming* mails, I have
the impression that they overlooked this.

If all fails, I'll construct a new emailaddress, the same as usual but
without the "." 's. But hold on till wednesday evening, I need some time
to set it up and check if it works correctly ;-)

Cheers from Belgium

Hi Maurits,

>Sorry your enourmously long rant was so full of stuff that didn't even
>remotely have anything to do with what I said that I can't be bothered
>to quote it all and reply to every detail that sparks a reaction in me,
>because I'd end up with a posting twice as long and I doubt anyone would
>read it. :)

I hope that at least you understand that it wasn't personal, your post got me going, but I could just as well replied to one of the seven others that day. I realise it was a long rant, I kept my mouth firlmly shut for months here while having to read the greatest crap. Let's say that a certain valued member who thinks he's special, constantly trying to provoke me sparked it of. I even received a mail from someone asking me if I'd gone berserk, but take note that I do not retract one single word of it. Unless proven wrong, the best way to show that I'm wrong is to start releasing all that stuff, even if it's a barely working beta. Then me and others here will at least know that something is cooking in the oven.

>1. I am not denouncing Andreas Kromke for his great work on Magic and
>the fact that he wants money for it. I'm just saying that in a community
>as small as it is (as you rightfully point out), an os that is developed
>by volunteers has more of a chance than an os that needs commercial
>backing.

I know that you're not denouncing Andreas Kromke, but that's about all I agree with. I think I made it quite clear in my previous post why I don't believe in a OS being developed by a group of volunteers, it might work on other platforms, but not on this one.

>Sure development of MiNT itself is slow but we did move on a few versions.
>Has Magic been so busy developping? What new functionality has been added
>in recent years?

No, the development is standing still at the moment. But then no one has claimed otherwise. There's a difference between being put on hold and being dead....

>As far as I can see, only stability improvements, something that MiNT+N.AES
>hardly needed in the first place.

Sorry but I disagree :-)
MINT itself is stable enough but are you serious about N.AES? If there's one piece of code that needs a large stability inprovement then IMO it's that

one. Apps which behaved very irratic run like they should with Xaess. As for MagiC, for me it's rock steady.... even MagiCMac behaves like I expect it to.
But yes, I can bring the whole lot down in less then 5 seconds, and I can bring MiNT down in 5 seconds also. All that one needs is one dirty app ;-)
And it doesn't matter on which OS it's running...

>Well, the thing that mostly needed development in MiNT: Easy
>installment. RPM handling was a great step, and now with several easy
>bootstrappers around, installing and configuring MiNTos to a fullblown
>Unix setup is a breeze even for newbies.

We have conflicting views again...
It's difficult enough for newbies to set up even an elementary MiNt setup and configure it correctly. I agree that the installation has improved compared to the mess from a couple of years ago, but to say that the full blown installation is a breeze even for newbies is putting it very mildly.

>3. Remember I left the Atari-NL mailinglist after a discussion like this
>with you? :) As you (and apparantly only you) know, I didn't leave
>because of the discussion itself (which I enjoyed because most of it was
>quite in-depth) but because other people of the list who were telling
>both of us that an Atari list shouldn't be about modern stuff, only
>about tos 1.00 issues and how to copy st games.

Yes, I remember. And I still get a dirty taste in my mouth when I think why and how you left the mailinglist. But I persevered and stayed on. The big issue in there is spam now... it seems that even a ST with TOS 1.00 isn't immune to it, if it's any consolation: the people who opposed you most, are long gone by now, enjoying their brandnew PC's ;-)

>So, I just wanted to add I'm glad we can talk about modern-day st use, and
>I still consider you a friend :)

Yes, but then we're exceptions on the rule. There was a time that in CSAST everyone could speak his peace, but these times are long gone. When one has a different view or opinion he better keeps them to himself. You should see the garbage which landed in my mailbox.... only two people had the guts to put their real name on the mails. They didn't agree with my views, but then I didn't expect them to either... But no matter what garbage one sends me, remember that I have the guts to post using my real name and address here. And rest assured... I'll keep on doing it :-)

Cheers from Belgium

One usally gets back from me what they've put in. In Lonny's case I think that I've been very considerate, read the posts again. I know what he does and although I don't use his programs don't mean that I don't appreciate it.
BUT.... (there's always a but), for almost a year now he's had it in for me, it started when he announced that I was in his killfile. That doesn't bother me one little bit, I presume I'm in one then more filter. However you either decide you don't want to read ones postings and logically don't reply to these either... the manner he replies in is personal, for some reason that guy really hates my guts.

How many people do you HATE because they express their honest opinion? I don't hate anyone, I disagree yes, and don't always like what I read in here, but to actually hate a person, who I've never seen in real life and don't really know at all? Sorry.... but there's simply no one on my hate list.
Last tuesday was the final straw, he obviously wants a confrontation, well he got one now. And I urge him to stop it, whatever happens I'm not going to give in.... this whole stupid thing will hurt his reputation more then mine.

Let's be honest about this Martin. We've had lots of serious discussions and confrontations with each other in different groups, I think I know you a little.... if someone would write:

"Due to poor quoting I am not sure who made this comment.
I suspect martin. rotfl!!!!"

How would you react? I'm convinced there wouldn't be much difference with how reacted. I have no idea how Lonny thinks, maybe he thought that just because I'm in his killfile, he's in mine as well and I wouldn't read all the crap in which he mentions, targets or provokes me.
Anyway, it's very simple: he gets of my back and I'll return to be my usual self, if he persist in it however....
I've been the sensible one long enough, not anymore.

Cheers from Belgium
Dennis

>I had some usenet problems

Again????
You really should consider using a different stack and newsreader. Well,
not really, there are other people here using the same combination and
they seem to manage just fine....
If you don't understand something, just ask.

>I must say the number of foul mouth posts from certain people was
>staggering.

Do you mean that you've been reading your own posts? Gee... what for? Is
your short term memory on the blink ?

>Needless to say I'm back to my usually reader.

The one with the crappy killfilter?

>They think it is funny or such but in reality everyone I've ever
>discussed this with on IRC or ICQ thinks these people are complete
>losers.

That's what happens when one always talks to the same people, one risks
to loose his sense of reality and think his views are the only ones worth
persuing. If I would talk to a bunch of clones, well, I wouldn't expect
anything differently.

>They wouldn't last 5 minutes on an IRC channel or in a mailing-list.

Wanna bet?

Cheers from Belgium
Dennis

That's about the Apple market share.
Compared to what on atari? 0.00000000000000001% market share.

what?
You are doing this on purpose.
Where the hell do you think any mp3 player (freeware, aniplay, commercial
whatever) is coming from?
The developer HAD to GET specs, src based from somewhere.
You think they reversed engineered all the software we have?
Question for Didier, if you didn't have any open src/gpl starting source

code for mp3 or video, could you have written aniplay?

I would really like to see a jpeg viewer on atari that didn't use the code available. Anyone to name one?

Dennis, you obviously don't understand this thread. Either get a grasp on it, or drop it and admit it, you just don't get it.
I would hope you would make some effort to understand really what we are talking about, it would save us a lot of time and you won't have to be ashamed.

See Dennis, there's 1 more thing you need to know.
I don't know anything about "Acting and Theatre", I am NOT going to talk and pretend I know what I am talking about when I am surrounded by actors. When you don't know, don't pretend. That's probably why you are so annoying, and you claim "freedom of speech", well yeah, but sometimes just keep your mouth shut.

I don't know anything about cars either, I am not gonna start a deep conversation about who's a better driver, or what's the best car around and argue to death because my little cousin few weeks ago mentionned something.

Freedom of speech is all good, but man, sometimes you gotta know when to shut up when you're just spewing things for the hell of it.

>
> gcc! : are you gonna write the missing libs ? :-)

what missing libs exactly are you talking about?
anything vital we need?
For your information GTK+ is available for MiNT :)
I know you are a big GUI fan, if you don't know what GTK+ is, please do some research.

> Mp3 players: yeah right, my TT just loves playing mp3's, AFAIK there's a
> very good alternative available: Aniplayer.

why are you talking about your hardware?
I thought we were talking about OSS/GPL and OS on atari. what the HELL are you talking about your TT not being fast enough to process mp3?
Geez Dennis....
good alternative to what??
mp3 has been documented, has src code available, that Didier took, and implemented in aniplayer, then recoded some parts in asm for more speed as the atari couldn't deal with it, and recoded some parts to use the DSP, once again to get faster.

I believe Didier is fairly happy mp3 src were available, unless he really wanted to reverse engineer, or go through an MP3 file and start from scratch analyzing the bytes :) yeah right.

> POV: oh boy, this takes me back some years... I think it was ported before
> both MagiC and MiNT existed... there are a couple of very good commercial

> alternatives around.

hmmm I am talking about POV and you are talking about 3d software.
Kinda like talking between GIF and PIC1 images.
propriatory vs open standard.. Whatever.

> Doom: I'm not into games anymore, and even if I was, I wouldn't really
> call that example a Atari game. Just look at the hardware that's needed,
> so like usual it's a port for the minority of the users.

hm who cares what you like to do? who called it an atari game?
It is an example that GPL allowed atari platform (all OS mixed) to have an
extra game to its collection.
Your TT don't run it fast enough? that's your problem. Talking about
software again here. Boy, you like to warp things don't you?

> perl: OK, I give you that one..., although I don't call that example
> exactly something which will be used by the majority of people here.

Who talked about majority of people?

> samba: and that one as well :-)
whatever.

> the GPL tag.

Is Ultrascript based on Ghostscript?

Ghostscript is NOT an atari program. It happens to run on atari as long as
someone compiles the code.
Ghostscripts keeps on getting updated all the time.
When non-gpl/non OSS is dead, that's it. It's dead.
When GPL ports are getting out of sync. It is just a matter of grabbing
latest new src and do a fresh compile. The development is NOT made on
atari or FOR atari.

What a very good excuse.
Actually, let me rephrase that, what a poor excuse.

>
> security: not needed on a one man, one computer system...

Very good for you. And because you don't use your rearview mirror in your
car, you should ban them all as it is not really necessary.
Of course the automotive industry won't listen to you, so you'll go on
rampage that it is not really vital.

Magic works for you, great now just shut the hell up or be open-minded
enough to realize a LOT of people might have different requirements than
yours.

> file locking: not needed at all

Geez.

> multi-user experience: I've answered that one already.

yeah, and i'll give you the same answer.

what's on top of your list?
Icons that talk to you when you go do a mouse-over?
Or wait, animated desktop background?
Oh no, I get it, mouse movement recognition?

Quote of the day.
"FATALER FEHLER IM GEMDOS!!!!"

WinSTon, and TOS 1.04. The original should run on any ST.

If you finished the baller2 stuff we can pack both together.
I think that baller2 features the previous release, too (see folder
'original').
Hence I suggest to bundle the results and upload them to one of the PD
servers.

regards
Jens

Hi Derryck,
Guess I'll have to look closer at the problem and ask some questions to
my ISP. I've also noticed that my posts sometimes take even up to 24 hours
to show up (hence my notes of apologizing for possible double posts....
thinking it never got there!). Damn, I'm probably even missing some of
Steve's sheep training lessons :)

Later,
John G.

Well the situation is my news server keeps going down, so to get around
that I telnet to an SGI box and use PINE which happens to be too old to
support filtering. I have no real issues with free speech, I do have
issues however with people that cannot grasp even the simplest concepts.
At some point you have to decide is this worth it, does it have value, is
it true? Frankly you are so miss-informed that you ended up in the kill
file. So I may or may not read your posts, it depends purely on chance.
Not much different than filtering out ADVerts. Someone out to put an end
to free speech would terminate your inet connection, no you are confused
again. You still have your free speech, just don't expect everyone to
accept it as fact. In general I find that I'm not that interested in what
you have to say, apparently that bugs you, so you have to find something
to blame it on. I hold your IQ responsible, but if it makes you sleep
better you can pretend I'm trying to pull the phone cord from the jack on
the wall.

On Fri, 11 Jul 2003, Dennis Vermeire wrote:

The more you go on the more you do a dis-service to yourself and
magic. Btw, don't bother dusting off the clone, you ain't getting in
with this sort of posting, finally you have showed your true colors
and it's the same as Steve. You merely wish to cause trouble for no
reason other than lack of respect and knowledge on your part.
Good luck with your usb/scsi solution, I never said it would never work
only that it might be harder. You really should take a step back
and decide if you wish to join ranks with the likes of Steve. Outside
of usenet the opinion of Steve is so low I can't even say the words it's
that bad. You make a good pair I guess, good luck to ya.
Sadly I think I won't be using PINE anymore, I will have to go 100%
filtering all the time, just to tolerate this place.
I also will consider wether it's worth supporting magic in the future,
if you guys are typical magic users it's not looking so good...
I would address every point here, but it's like a total waste of time
since from the onset it has become obvious you have issues with people
who can afford a clone, who use mint, who like unix, or show any general
insterst towards moving forward, rather than sitting here blabbing about
it. You have just as much oppertunity, I could call you the self
proclaimed scsi->usb adapter guru, but that's silly. Grow up.

was to bored to quote right, so sue me...

Part of the problem is interpretation I think. No one is trying to tell
anyone to switch to mint, if magic works for someone, cool. In that
situation magic is superior. Especially if you are happy.

However on a pure feature by feature comparison mint comes out on top,
hands down. For the power use that has a requirement for memory
protection or file locking, there is an option. Just cause magic falls
short in some areas doesn't mean it's not useful to someone else.
Neither is perfect.

No big deal, use what you need. For some reason people can't disassociate
the 2 points, and it's taken as a slam. Since the magic user went off
half cocked it all out of wack, and I don't see dennis spitting out
a "sorry i was wrong". He's rather argue all which way, jump around
all over the place, before ever uttering that. For a moment I thought
it could be worked out, but after seeing the post in here unfiltered
I can see it's hopeless.

Whatever the problem is, dennis won't admit to being wrong or confused.
Plenty of gem apps are based on unix open source, even AtarIRC although
I had to port "C" to GFA. ;-)

I also think the thread has simply grown to the point where dennis
is just arguing for the pure sport of arguing, otherwise I never
seen someone that out of touch.

Trust me you won't ressemble me at all, unless you pick up some coding
tools and start actually giving back to the community as I have.
If you feel magic is good, fine. Code some apps for it and stop with
the BS. That might require actually looking at open source GPL code
or heavy duty reverse engineering. Etheir way, I'd prefer to see some
new apps from you than a bunch of worthless posts. If you need some
coding tips, docs, see my website.

Just go to google type my name, you know it well... ;-)

I don't have it in for anyone. I tried like hell to explain the
subtle difference between PINE and a CLI. Sorry but you didn't grasp
it or didn't want to grasp it. I don't even care anymore.
A killfile in not automated hatred, it's simply a choice to read
or not read posts from specific individuals or remove ads.
All I can say is the thread went wrong somewhere, I don't
care at which end it went wrong at either. It's long past.

It's nice to know I have room to grow. I wanted to let you know that I really enjoyed all the suggestions! Part of me says I will never be bored with the TT 030, and the other part feels frustration because some options are drying up, or gone.

Oh well, and then some things are bought and then just reappear on the market again. Or new solutions come up.

Just awesome!

I am sick of ID10Ts on eBay. People trying to scam every cent off their vintage gear. I am glad there are still Atari dealers where I can spend decent money on quality gear at a fair price. One thing I hate is when people sell their crap for more than you can get it at the dealers! Especially with an opening bid! It's one thing to start the bid low and see where it ends...

Unbelievable!!!

Tim

winston and tos 1.04.
If you finished baller2 we could bundle both versions and put them on
one of the PD servers.

regards
Jens

4704. FS ADVERT(UK) SCSI Flatbed Scanner hardware/software

Newsgroup: comp.sys.atari.st
Date: 2003-07-16 12:01:36 UTC
From: Mike Kerslake <usenet@kerslake.plus.com>
Message-ID: <3o0htk8wa2nl.1lmo4o963k3tb.dlg@40tude.net>
Source record: 25486

For Sale
Microtek SCSI Scanmaker E3 flatbed scanner and Scan X software. Used successfully with my Falcon and ST. Bought new from Titan Designs some years ago. It's had approximately 100 hours use. Very Good Condition. Complete with Atari Scan X software and also a PC ISA card and software so you could use it with an older PC as I have done, or with a newer PC if you have a SCSI interface or a USB to SCSI connector. Complete with box and manuals etc.

Feel free to make a reasonable offer. I'm located in South West Wales if you want to see/collect.

If you're interested email me at:

mike@kerslake.plus.com

Best wishes
Mike Kerslake

Hi Dennis,

> True, I should have put a winking smile behind that statement. There are
> people here who's stomach gets upset when the words ASH or Iconnect are
> mentioned.

Or "CAB" in my case. ;) Nah but considering the fact that STiK was actually written for CAB in the first place and that CAB had a MiNTnet overlay before Iconnect even existed, you're bound to upset some stomachs here. :)

> I agree, but CAB is the best from the rest of other awfull apps pretending
> to be browsers. People who don't have anything else then a real Atari at
> home have little choice.

True, because it's the most finished one. But that's really the best comment I can give it. :)

> BTW: you should try out Safari... rumours have it that its a cute little
> browser ;-),

Already using it, since os-x's auto-update stuffed it down my throat. :) (Well I could have deselected it, but I was curious). :) Haven't used it very much yet but it looks promising. At least it hasn't crashed on me yet. :)

It would be nice if Safari can cut down the number of browsers I have to use on my Mac.. so far I was using Chimera whenever possible (after getting annoyed with all the bugs and random crashes in msie and netscape), but needed msie for any site with bad javascript (since msie is the most "stupid html designer errors-compliant"), and needed netscape 6 because it's the only Mac browser in the world that will work with Girotel (internet banking).

Haven't tried Safari with Girotel yet. ;)

> under OS 9.2.2 I think Opera is the best of the bunch, iCAB
> just like on Atari doesn't quite cut it...

Heheh no I don't see Cab surviving the competition on the Mac platform. :)

> I have to be very carefull and walk on eggshells now:
> Since Highwire still carries the beta tag, it's not really fair to comment
> on it. Not that there's a lot to comment on, I can only use it as a very
> primitive offline browser since it's not an Iconnect client.

Well it's very unfinished but all the functionality that it *does* have, looks a lot better (especially faster) than Cab already. And since it's

still being developed, I'm keeping my hopes up. :)

Maurits.

> ignorant people either.

It's not just the number, it's the rise. Look at Microsoft's fears of
Linux. Look at major companies like Compaq/HP, IBM etc all starting up
serious Linux support. Philips has joined with several companies to
start up an Embedded Linux platform. Look at the city of Munich, who is
replacing Windows and m$-office with Linux and OpenOffice on the 14,000
PCs of their civil servants (when this was announced, Microsoft's stock
value decreased 1.5%).

This is all just the beginning. Unices and open source are the way to go. :)

Ok this kinda deviates from the topic, but the thought that linux is
just a toy and not a serious competitor is really a naivity of the past. :)

Maurits.

> me going, but I could just as well replied to one of the seven others that
> day.

Ok that explains something. :) Actually I just rejoined csas a few weeks
ago (looking for a solution of my Nova/VME probs). So I missed most of this.

> Sorry but I disagree :-)
> MINT itself is stable enough but are you serious about N.AES? If there's one
> piece of code that needs a large stability inprovement then IMO it's that
> one.

Hmm, I guess I'm lucky then. :) Even 1.0.0 was rock solid for me.

> Apps which behaved very irratic run like they should with Xaess.

You mean XaAES is more stable than n.aes? I doubt it, although I must
add that XaAES'es "instability" is mostly because of missing features
since it's not yet finished. I must also add that I haven't tried it for
a long time and a LOT of updates have been released since the last time.
(By volunteers..) ;)

> We have conflicting views again...
> It's difficult enough for newbies to set up even an elementary MiNt setup

Oh dear look what the world is coming to. :)

> if it's any consolation: the people who opposed you most, are
> long gone by now, enjoying their brandnew PC's ;-)

Hmm that was to be expected. :) I still see similar stuff happening in
atari-midi though, although slightly different.. when you speak there
about using an Atari for audio recording (not even promoting it, but for
example just asking a question about it) you'll get about 5 replies from
people who will tell you that you should (must) use a pc or mac for
audio because an Atari is completely unsuitable. When you disagree with

them and offer some defence for the Ataris (stability, no spyware, perfect timing..) you'll get mails varying from friendly remarks to downright flames saying you should be "open minded" about talking PC stuff on an atari list. The pot calling the kettle black. :)

In one of these discussions I was even called an "Atari-imaam" who wanted to "brainwash everyone", by someone who I think was also on atari-nl. :)

> Yes, but then we're exceptions on the rule. There was a time that in CSAST
> everyone could speak his peace, but these times are long gone.

Well I've only known csas as a place full of flamefights.. :) But at least Atari stuff is still considered on-topic here. :)

> I didn't expect them to either... But no matter what garbage one sends me,
> remember that I have the guts to post using my real name and address here.
> And rest assured... I'll keep on doing it :-)

Heh good for you :) Well my name is real but I'm using a fake email address only because of the enormous loads of spam I received after posting my email address in a newsgroup posting just once, years ago. So I'm hiding my new email address. :)

Maurits.

Hi,

Well try Capy... We did think on TT when developing it, but noone had TT, so it wasnt tested much. Later i got TT and i just briefly ran it and it was ok, with some minor musix glitches... Its puzzler, some kind of Oxyd/StoneAge/Sokoban mix.. U can get it on http://yescrew.atari.org in YC Product section... Otherwise i didnt play any games on TT, but i hear there is Vroom for it, and Vroom is great game! Maybe even StuntRacer works, as it work ok on Falcon as well...

Janez

P.S.: Capy only run on Shifter video (builtin) and in 640*480*16 mode....

Can't speak for the 8 bit crowd, but I've never ever paid too much or gotten a bad sale at all. In fact the guy who sold me my Falcon threw in so many extras it was absurd. Nothing but love for eBay atari sales. Don't be upset because YOU think they set their prices too high. If someone's bidding on it, then guess what, someone thinks it's worth more than you can/will pay. If nobody is, the item doesn't sell and the lister wasted their money? Who loses? Not you unless you buy it. I love it when people project buyer remorse and general consumer idiocy onto others as if it's not actually THEIR fault when they didn't read a scam artist's feedback properly, or when they received a dirty run down product (as listed). Don't push your dealer crap, because there's simply NO better source of good Atari deals on a national/international level then ebay. Of course stumbling upon a collection with 2 Falcons going for $5 at a garage sale is another matter entirely ;-) I consider most Atari dealers for the source of "I really want x part, I know the Atari dealers will have it. I know I will get good service, do I really want to pay x times more than this item is worth to get it?" 9 out of 10 times I choose no and patronize ebay. The whole problem with people that act like you is that they are mindless and don't understand the concept. It's about competition. The people that hate competition are usually lazy and get beaten. Hence, if someone likes the product more than you and bids more, it benefits BOTH the person that wanted it more, AND the seller. If it's overpriced, buy from the dealer? Nobody held a gun to your head and made you click "bid now".

WTF?!

I'm actually considering selling some of my Atari gear on eBay, but now I have to worry about people like you scaring away fence sitters from quality products.. *sigh*

The other week some guy gave me crap about selling a laptop with a buy it now price of $1350 and a reserve price of $1250. What's so hard to

understand about "I paid a lot for this laptop so I refuse to let it go for under $1250, but at the same time I'm not going to try to extort money out of my customer by posting a massively inflated by it now price". Some things will never cease to amaze me. The point of an auction listing is not always to start at $1. Sometimes it's just to get international viewing for your sale.

Well, a couple of the .ST image files required 82 tracks / 10 sectors,
and my PC's floppy drive was able to correctly format and write to the
disks. And two of the image files that MAKEDISK claimed were
"corrupted" were the same size as the ones that worked. So who knows?
But thanks for the tip, I just downloaded a copy of vga copy 6.25, and
will give it a try.

Hallo Dennis!

DV>Not that there's a lot to comment on, I can only use it as a very
DV>primitive offline browser since it's not an Iconnect client.

Well, with MagiCNet, MiNT-Net and STinG it's already working online.
The public beta doesn't support pictures yet, though, and there's no support
for other image formats than GIF anyway, but things are progressing. The latest
non-public alpha is already capable of showing online GIFs, but there's no
cache yet. But things are improving all the time, and both stability and speed
are very good, especially if it comes to rendering large tables.

With best regards
Ekkehard

In case you didn't realise it, you don't need the whole eed file once you've copied texts to be translated to another file. Just recombine your segments into a file with eed's header and footer, resave and patch with eed. It will take care of the non-contiguous text automatically.

N.AES has been very stable here as well. There is smal catch, for gfx card owners, or guys with ct2/etc and big resolutions. U need to use bigger qsbchars, cqsbchars, mpipesize and sstacksize buffers, usualy doubling them helps... If some use extended res and experience odd freezes, thats the cause... I also use a trick for recovering from some realy bad applications, usualy games or demos.. I did install NCHRES to f9 key.. so when such app return with messed screen, i press f9, ret, ret and that is.

Hi Mark D sure love to chat it up with you again ;) !

I guess I need to go back to school and relearn english. I am not bad
mouthing ebay at all. I love ebay. I buy a lot of stuff on there and most
at really good prices. And I will continue to browse ebay and buy off
there. What I was trying to say in my post was I hate it when an idiot trys
to sell something for the same price as I can get it at a dealer.

Again I quoted: "One thing I hate is when people sell their crap for more
than you can get it at the dealers!"

Was that not spelled out correctly? Maybe I need to retake English 101 I
don't know...

I don't know about you guys, but if someone lists a Atari 130XE NEW in the
box for $149.99 on ebay, I would rather buy it for one cent more at a
reputable Atari dealer!

Am I wrong for thinking that? Is it only ME that thinks these people set
their prices too high when the price is the same as the dealer???

If you disagree then YOU are the idiot!

Tim

Actually the response was idiotic as he did not understand what I was trying
to say. I was not talking about the normal scheme of things on ebay, I was
talking about someone listing something at or near the retail cost of
getting it from a dealer.

Actually if people do not do their research and buy something for the same
or higher price than you can get it, they are the ones that are Mindless,
not me...

Tim,

You make too many blanket statements. Your comments will scare well intentioned cautious people away from eBay completely, based on a few auctions you have seen and haven't even purchased probably. In some circumstances, if the auction is for new in box item, the exact same price as dealer and the seller has reputable feedback, what makes them better or worse than a dealer working out of his basement? ;-)

You're insinuating that eBay is crap if the auction starts at $149 which is the same as dealer cost. The person simply won't accept less, just like a dealer, however they're opening to a national audience and other people might be willing to pay more simply because they dont' feel like doing research to find a still active dealer or don't LIKE the current selection of dealers ;-)

sounds like it may get confusing since the layout in Baller 1 is
different than Baller2. I'd be concerned that the lines of text might
not fit properly in both games fields although if the text is the same in
both then it probably will workm out. It seems simpler to stick with the
EED from the same version (cut/paste/done :)

Ah well see I see it differently. eBay is a Thrift store!!! Period. Items should be less than a dealer. Period. And that is where it has gotten out of hand. With a store or dealer you get a warantee or refund or other options. With individuals you normally get nothing. AS IS. Now *Some* people are honest and will give you a refund. I have had some excellent dealings with people on ebay. Don't get me wrong the magority of my time on ebay has been great. Only 1 bad experience out if hundreds. I even got a NEW in the box XF551 for like $140 recently! That was a fair price since you can't even get a new one anywhere and a unsed one sells for $175 at B & C. Now if they had a new one for $150 I would never pay more than about 80% of the cost on ebay. Why risk it?

The reason for my rant is that I see shit ending for more that you can get it at a store. (Like NEW stuff, ie DVD movies, TV's PC parts etc) The reason it is so is because of these idiots that have no life and will not tolerate someone out bidding them!!!!!!!!!! Or they are 400lbs and don't

want to get off their fat ass and buy it in the store. LOL

I thought I made it clear anout idiots on ebay and high prices, not the overall ebay experience...

Am I wrong???

Tim

4731. Magic, MiNT, GPL?

Newsgroup: comp.sys.atari.st
Date: 2003-07-17 08:21:21 UTC
From: Janez Valant <swe@atari.org>
Message-ID: <I7sRa.342$2B6.56658@news.siol.net>
Source record: 25412

To all who feels MiNT vs Megic debate went to far:

> If you feel magic is good, fine. Code some apps for it and stop with
> the BS. That might require actually looking at open source GPL code
> or heavy duty reverse engineering.

Id like to clear something here... There are actualy no Magic or MiNT apps, that may be the core of the problem.. Magic and MiNT are ATARI OSes, with AES, GEMDOS bla bla, so any application will run on both OSes. The only real problem is using non modular, exclusive inet stack..., but thats not OS problem. Any ATARI application will work in both systems. There may be some "look'n'feel" diferences etc, but imho thats not reason to declare any os as useless, stupid, or even stronger words, usualy used here... But, all apps which uses ATARI resources and conventions (bios, xbios, gemdos, vdi and so on) will work on both.. even more, a lot of cli apps, compiled on MiNT with gcc will also work on TOS/Magic as .ttp in any decent shell, preferably Mupfel. This is clear indication that even so hated MiNT developers does wana preserve Atari, and not make just another Unix clone. Mind u, those unix apps werent created with any of ATARI conventions in mind, yet they can be easily used on any ATARI. And for example, "split" and "cat" can be easily used for splitting and rejoining files if u need to migrate them on floppies via Ataris and Unices etc.. faster on our not so powerfull cpu machines as "arj" etc... All u need is to rename them from Unix style "xxxx" to "xxxx.ttp" and run in TOS or Magic.. or as better solution, copy it in Mupfel's bin directory.. Iwe used Mupfel a lot in Magic, and it did make my life easier..

What is Papyrus? Magic or MiNT app? Or AtackMail? Magic or MiNT? Use MiNTNet ovl and runs in MiNT, use Stik and use in Magic... All those are ATARI apps, useless to argue nout OSes. Personaly only bad thing i find in let say ASH emailer, is its Iconnect only nature... with Stik ability, im sure even MiNTers would buy it.. I dont dislike fact that Emailer is commercial, i dislike fact its bonded to one OS only... Thats the problem. But on other side. thats problem of ASH. They could sell lotsa copies more. Before AtackMail, there realy was no decent GEM mailer, and im sure many Stik users would buy Emailer.... Maybe even now... But i wont buy Emailer if i also need to buy Magic.. and then other apps....

THIS is the core of problem, not Magic/application being commercial. All hated MiNTers in here, bought N.AES and Thing, as well as many other applications, money or being anticommercialistic is not the problem, indeed.

>>That might require actually looking at open source GPL code
>> or heavy duty reverse engineering.
>

> Ah!, this is the first time you have publicly addmitted to theft. Who's
> code did you steal?

Where exactly Lonny said that? This is main problem, since u guys cant (wont) grasp that u MAY use GPLed code.. Thats legal way. Illegal way is reverse engineering.. And GPL code is source of all goodies lately introduced to us (Atari users)... Read Aniplayer docs and ull see what all Didier managed to add because of GPL! (he wouldnt be able that without). And here another core of the problem apears: fact that someone use GPL code, does NOT means he cant charge for his product! I gladly payed fee for Aniplayer, as i did for many apps. GPL means code is FREE to use or adopt, under some "regulations". Using GPL code also dont mean that application is not real Atari application. And last, but not least, if someone choosed to release his code as GPL or FREE, that by no means mean, that code is bad, or inferior. And by no means, that also mean that coder, using GPLed code is inferrior! Didier has done great work adopting the jpeg/mp3 (from mp123) into ASM/DSP and optimising it... And he didnt steal NOTHING. Ani would be a lot poorer without GPL, and also a lot worse, if Didier wouldnt do great job adopting and optimising the GPL code.. Just to mention, piece of GPL code, let say mp3 decoder, is not slow cause its coder is bad, but because main goal is portability... There is realy not much use to release mp3 decoder in i386 asm and heaviliy optimised to wide pulblic... Implementing that on any other platform, would realy be painfull...

I must second that... Also, this is not programmers vs nonporgrammers crap! None say programeras are being more as plain users.. Also users are entitled and encouraged for remarks, criticism and opinions.. As long that is not the case of Dennis/Steve, which realy is insulting, and bashing and hatery...

I doubt ANY dealer would say no, if id offer $200 for product labeled
$149 :)))

On other hand, seeking for a dealer ouside .de or .uk or .us may be
futile job. In many cases, ebay with $149 price, esp if "buy it now" label,
with seller in local area is beter solution... On end, it comes down to
buyer anyway... if buyer accept "idiot" sellers price, "idiotism" migrate
from seller to buyer.. But as i said, i rather pay 150 in .si, as order 149
XE from .uk, and pay 40 or more for shiping....

Are you sure about this? Sounds like you're talking about Overscan
TT. I'm quite sure that the AlberTT card is a "real" graphics card. A
weird one, but real...

> you want more (and it will come), go hunting on the German eBay site for a

> run with NVDI, and they perform equally well under MagiC, MiNT and singleTOS

I have a Crazy Dots in my TT and had a Nova/Mach64 in my Falcon for many
years. The Nova is faster and very compatible, the Crazy Dots (or any
other ET4000-based card for that matter) is not faster than standard TT
graphics, but it's even more compatible than Nova cards/VDI. I'd still
prefer a Nova card, but a Crazy Dots it's not a bad choice either.

> It's the most expandable computer Atari ever made. If you are really lucky
> then perhaps you might even get hold of a CaTTamaran processor upgrade. If
> you can locate one do the following: get a 68030/50Mhz processor, fit the

You can also easily speed up the TT the "Falcon way", by replacing the
original oscillator with a faster one and feed the ACIA's with 500Hz
clocks. I've tested this on my TT (40MHz, the only oscillator I had at the
time), and it works very well. The only problem is that you need a
graphics card as well.

> CaTTamaran, hack it and let the whole sh-bang run at 66Mhz. The regular

No, it won't. The CPU will, but not the rest.

> processor isn't stable at that speed and overheats, but the 50Mhz version
> runs flawless... anyway, you'll have a TT which runs twice as fast and when
> a Nova card is fitted will even outrun a standard Milan 040 (I speak from
> experience).

Hmm... An overclocked TT with a Nova card is fast, but not as fast as a
Milan040! The Milan still have faster RAM, faster disk, faster graphics
and a faster CPU...

> mices and a keyboard, but that's about it. The TT is build to withstand
> worldwar III :-)

Very true.

> I hope you have as much fun with your TT as I have had all these years,
> Falcon users will disagree, but IMO the TT was Atari's masterpiece.

I am (or *was*, as my Falcon is now sadly collecting dust with my other
Ataris and clone(s)) a Falcon user and will agree with you. Still think
the Falcon was more fun though, even though it's a poor design.

It is real graphic card. I had one, and i sent it to Draco. He also did
better drivers for it and if i recall AlberTT can do 1024*768*4bit, not
sure for 8/16/24 bit.

4740. Linking a TT & Falcon via the lan port

Newsgroup: comp.sys.atari.st
Date: 2003-07-17 15:43:24 UTC
From: Rob <rob19@eggconnect.net>
Message-ID: <mogdhvs7r032l8m09pust894ms5n5ghk2u@4ax.com>
Source record: 25422

I don't know if this can be done, so really I'm asking two
questions...

1) Can it simply be done by getting a cable and plugging into the lan
ports on both machines... What software would be required (does it act
like a network where you could see one's drives on the other's screen)

2) Are their any complications (they currently run at different speeds
etc...), or was the lan port only for use with apple computers (I've
heard it called apple talk)

Thanks for any thoughts on the subject... Rob

Well if the item was in my town or close by I might go for it at the same
price, but if I can get it from a reputable dealer like B & C I'd rather
support the dealer! Now if the ebay seller wants to do me up a good deal
then thats a different story!

Exactly that. And as I said, don't lose the header or footer!

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000? Or were you an otherwise active member of the aforementioned scene?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

Don't take this to personal Richard. You've done in the past a very good
job which the Atari community certainly very much appreciates.
Nowadays the danger of new Atari virus is almost non-existent but it's
great to know you're still around.

Thanks for supporting the Atari community for all these years,
Martin

Source record: 25445

From: Frederic Fouche <g213778@coazter.com>
Date: Tue, 15 Jul 2003 15:05:36 -0500

Hi Frederic,

>I thought we were talking about OSS/GPL and OS on atari.

Sure we are, but that stuff needs hardware to run on, and you seem to think that every remaining Atari user has at least a Falcon with 68040 upgrade in front of him. And that's one of the main reasons that I doubt that MiNT and the ported stuff is used by the largest group of users. They might give it a go if their hardware was up to it, alas it isn't...

>what the HELL are you talking about your TT not being fast enough to process
>mp3?

Excuse me for being a TT user... but yes, unfortunately the TT is not fast enough, it can't play MP3's in real time, let alone process them. A TT user has to convert the MP3 files first into WAV or AIF. Note that I wrote "play", under processing I understand something different. Converting those MP3's take quite some time also, one must really be persistent to follow that route...

>hm who cares what you like to do? who called it an atari game?
>It is an example that GPL allowed atari platform (all OS mixed) to have an
>extra game to its collection.
>Your TT don't run it fast enough? that's your problem. Talking about
>software again here. Boy, you like to warp things don't you?

I can't believe I'm reading this !!!
So you find it normal that software is ported that most likely will only run on maximum 10% of our hardware? And then you are surprised that I object to this?

>> perl: OK, I give you that one..., although I don't call that example
>> exactly something which will be used by the majority of people here.
>
>Who talked about majority of people?

I did, and I started this thread, remember?
If someone ports perl, fine, I'm convinced that a couple of people will find it very usefull, but the majority of the users is not waiting on stuff like this being ported over.

>Is Ultrascript based on Ghostscript?

Absolutely not... it's 100% commercial.

>Ghostscript is NOT an atari program. It happens to run on atari as long as
>someone compiles the code.
>Ghostscripts keeps on getting updated all the time.
>When non-gpl/non OSS is dead, that's it. It's dead.
>When GPL ports are getting out of sync. It is just a matter of grabbing
>latest new src and do a fresh compile. The development is NOT made on
>atari or FOR atari.

Look, you can put it in ten different ways to me, the outcome will always be the same: the Atari Ghostscript port is out of sync (as you put it), are you going to deny that in practice the end result is just the same? People using Ghostscript know only one thing: it's outdated. I don't think they care much about the status of the application, be it commercial, shareware, freeware or open source.... they're stuck with what they've got.

>It is just a matter of grabbing latest new src and do a fresh compile.

Not that old cracked record again !!!
So, all I need to do is grab that source , compile it tonight, and tomorrow we'll have the latest version of Ghostscript running happily on our platform? If it's that bloody simple.... :-)

>>MagiC isn't ment to be used in a multi-users network. It's an Atari OS,
>>and the hardware concept doesn't allow networking without 3th parties
>>hacks. So keeping this in mind...
>
>What a very good excuse.
>Actually, let me rephrase that, what a poor excuse.

OK, call it whatever you want, blame it on Atari and their lack of vision if you like. The facts can't be changed, the concept of MagiC didn't envision networking.

>>security: not needed on a one man, one computer system...
>
>Very good for you. And because you don't use your rearview mirror in your
>car, you should ban them all as it is not really necessary.
>Of course the automotive industry won't listen to you, so you'll go on
>rampage that it is not really vital.

Oh come one, you know very well what I ment. Do I really have to explain everything in detail?

>Magic works for you, great now just shut the hell up or be open-minded
>enough to realize a LOT of people might have different requirements than
>yours.

That so-called LOT only exists in your dreams, the LARGEST LOT of Atari users have other requieremements then you and SOME OTHERS. You do know the difference between a "lot" and "some" I assume?

And that's what this thread is all about, people are leaving this platform because their requieremements aren't met (anymore) and there's no hope at all that they'll ever be. You and some other people in this group don't see the

problems, the stuff you need is available, so everything is just hunky dory.
The reality however is somewhat different...

>what's on top of your list?
>Icons that talk to you when you go do a mouse-over?
>Or wait, animated desktop background?
>Oh no, I get it, mouse movement recognition?

No not really, and these silly examples haven't got anything to do with the OS
either, an updated Jinnee or Thing would be enough... but then I expected such
a reply from you, after all, you're the guy who declared every MagiC user to be
a qualified retarded idiot.

Cheers from Belgium
Dennis

From: Janez Valant <swe@atari.org>
Date: Thu, 17 Jul 2003 10:28:38 +0200

Hi Janez,

>>>Trust me you won't ressemble me at all, unless you pick up some coding
>>>tools and start actually giving back to the community as I have.
>
>>I must second that... Also, this is not programmers vs nonporgrammers
>>crap!

In less then a year I've had two confrontations here with programmers, and it wasn't because I criticised or questioned their efforts. And if I'm not carefull there's bound to be a confrontation with two more soon...

>None say programeras are being more as plain users..

Oh, but then you've missed a post !
In this particular case it's the programmer telling the plain user that he deserves special treatment and looking back at previous postings it's not the first time. He has a long standing record of telling us all that he deserves a higher ranking in here because he's a programmer... well Janez , you are absolutely right, people with such an attitude start me up. I do not accept such an attitude in the real world from anyone, so why should I accept it in here?
As for the bashing and insults: Lonny started it for whatever reason, I've ignored it a couple of times but there's a limit. True, Lonny did choose a more subtle way to express his feelings, but in the end the result is just the same. You're not going to tell me I hope that a programmer is allowed to insult and bash "ordinary" people? I don't expect apologies or whatever, I just expect it to stop, if it doesn't then I'll continue also. This is not a mailing list where he's in full control.

>As long that is not the case of Dennis/Steve, which realy is insulting,
>and bashing and hatery...

The people following and posting in this group have one thing in common, we all love using Atari apps running under a Atari OS, be it on the original hardware, the clones or even emulation, if we didn't we would have switched over a long time ago. We happen to use use different apps and different OS's to achieve the same thing. Do you honestly think that before helping someone out I inspect his credentials and if it so happens to be a MiNT user or a non-contributing member of this community I'll leave him standing in the cold? Read everything that I ever posted on Google, you won't find one single posting in which I even mention that I translate some stuff on a blue monday, and you won't find one single post in which I portrait to

deserve more respect either...
You have no idea of how many people in this group I've helped crack a problem, the mountain of mails with large attachments I've mailed years on end from a pay by the second dial up connection. If everyone who ever received disks, books, manuals, CD's, games, apps etc from me would come forward here (please don't), you would fall backwards. Oh and unlike some other people I never asked one single cent for it, not even the postage costs.
If somebody here has a hardware problem and it so happens that I happen to have a spare part laying around gathering dust, you can bet anthing you've got on it that there's a jiffy bag or parcel on the way from Belgium to help the guy out. I'm not Ben Smith who has to make a living. Knowing that I can help a fellow Atarian is good enough for me, and what kind of Atari or OS he uses doesn't make any difference at all...

Someone who shall remain anonymous mailed me last week accusing me of messing with other people their work, that's how he described in his own unique style my translation work, well Janez, that has hurt me much more then all the crap posted here the last couple of years. I've now reached the stage where I have to question if what I've been doing for the last fifteen years has been usefull to anyone and if I should continue doing it. Someone writing that I contribute zero back to this platform doesn't bother me one little bit, it's ment as an insult and that's how I regard it. But that "messing with other people their work" got to me somehow.... I've never made a translation public without the consent of the programmer or author, so I can comfort myself at least knowing that whatever I messed up had their blessing.

Have you any idea how difficult it is to produce a "good" translation? One only has to read the Ballerburg thread to realise that it involves more then switching words around. Once the code is translated the translator has the responsability to make sure that the app still works correctly. Any programmer which work has been translated should be able to tell you that there's no better betatester around then a translator. We not only have to translate the program but also test every feature out.... You have no idea how many bugs me and Derryck found in countless apps which otherwise would have slipped through unnoticed. Some 15 years ago I started translating German docs and manuals into Dutch (my native language) and English. As a non native German nor English speaking person this is not so easily done then it is said. If you knew how much sweat it costed me and how many times I started a translation all over again from scratch because when I looked at it in an objective manner I came to the conclusion that it was crap you would think that I'm a maniac. Anyway, after a couple of years I felt confident enough to give apps a go... and yes, looking back at what I produced doesn't really make me proud. If I could do it all over again today those translated apps would be of a much higher quality. Experience is the key word here... most of my earlier work needs to be rephrased not to mention that some even contain errors. But even if the standard is quite low compared to what we produce today, at least it allowed the English speaking community to enjoy the apps... have you any idea how many little German jewels there are out there? Unknown to the English community because

they never were translated?

A couple of years ago Derryck and me joined forces an D&D translations were born, from that moment on the quality of our work improved dramaticly, I usally make a rough initial translation and then Derryck refines it, weeds out spelling errors and rephrases a *lot*. A little later Peter joined us and DDP was born. Today, we are the only people on this platform devoting their valuable time translating apps, docs & manuals. We're not doing it for ourselves, there's a lot of translated stuff which we don't personally use, we do it for you, the community....
Take a look at your hard disk, almost any app that originates from Germany has been translated, only a very small minority of German programmers don't need a translator and are capable of producing an English version themself.

Try imagining how much fun you would have working with a German desktop program, getting back German error messages... I think it's safe to say that almost 80% of software originating from Germany has passed through the hands of Peter, Derryck or me.
Every avid Calamus user should thank Peter and Derryck on his bended knees for devoting 6 months of their life to it. Imagine working with a German Calamus & modules, not to mention the manuals, no one can grasp what has passed through Peter, Derryck and my hands the last 10 years. We don't come bragging about it in here or anywhere else for that matter, after all we don't create anything, we just mess up others their work...

Where does Steve fit in?
Well outside of usenet:
Steve happens to be the person who test out our work, if it wasn't for him a lot of apps would look different, not to mention contain bugs. Steve is a wizard when it comes down to finding bugs, typo's and errors. How d'you think he does it? He has spend countless hours of his valuable time turning apps upside down and inside out making sure that after our "treatment" they still work properly. Nobody asked him or forced him, he just volunteered to do it. The end result is that you the users benefit from it... And even if that would be "all" he does for this community, well, it's a hell of a lot more then some of the faul mouthed in here have ever done. But then you should talk to a member of the Cheshunt Atari computer club and hear their views on what Steve does for this community.... you'll find out that not everyone their opinion of Steve outside usenet is so low, that they can't even pronounce the words...

Oh and one more issue before I end this yet again long post:
When I state that the future of this platform is looking bleak it's more then just some unjustified rambling from my behalf.
For the very first time ever there's nothing in the pipeline... I have no beta version of a soon to be released in need of a translation program, no contact with one single German progammer working on something new... it's dead calm. It's like all the German programmers decided collectively to stop. That probably doesn't worry you one little bit, but it worries me, the last five years have shown me that except for a lot of blablabla not to expect a lot from the open source and GPL fans, and until this very day

they haven't shown that I'm wrong. *nothing* essential has materialized yet
from that part of the woods...

Cheers from Belgium
Dennis

From: Lonny <lp060@coazter.com>
Date: Tue, 15 Jul 2003 18:00:30 -0500

>don't bother dusting off the clone, you ain't getting in
>with this sort of posting,

Why ain't I surprised.. I should have known that it's a closed and
moderated list. Nice Lonny, that way you ensure that you're the guru in
there and only allow your fans in.

>finally you have showed your true colors and it's the same as Steve.

Pink with large reflecting orange dots

>You merely wish to cause trouble for no reason other than lack of respect
>and knowledge on your part.

I'm not the one writing "people like dennis", "the likes of dennis", don't
play dumb, you knew very well that I would react to it one day.
You want respect? I give respect to people who deserve respect, respect is
something one has to earn. Before I give any respect to you....

>Good luck with your usb/scsi solution, I never said it would never work
>only that it might be harder.

It's not my solution, it's just a different proposal and view as the one
you came up with. You're solution involves developing the drivers twice, it
will be a bloody miracle if they are developed in the first place, I can
not see two miracles happening to this platform.

>You really should take a step back and decide if you wish to join ranks
>with the likes of Steve.

Steve is a Atari user, and a knowlegdable one when it comes down to it,
that's good enough for me.

>Outside of usenet the opinion of Steve is so low I can't even say the
>words it's that bad. You make a good pair I guess, good luck to ya.

Do you really think that bothers me one little bit? I'm convinced, in fact
I know for a fact that there are places outside of usenet where his input
and help is valued. You see Lonny, it all depends where you hang out, you
seem to visit the wrong places and listen to the wrong people.

>Sadly I think I won't be using PINE anymore, I will have to go 100%
>filtering all the time, just to tolerate this place.

Didn't I told you so a long time ago ? :-)

>I would address every point here, but it's like a total waste of time
>since from the onset it has become obvious you have issues with people
>who can afford a clone, who use mint, who like unix, or show any general
>insterst towards moving forward, rather than sitting here blabbing about
>it.

Sorry, wrong again... I have a clone, and my contacts with MiNT users are fine, I think I have more contact with MiNT users then you with Magic users for that matter. As for unix... it's my opinion that it doesn't belong on this platform. The native Atari hardware isn't suited for it. That's another large difference between the two of us... just because I happen to have a clone doesn't mean that I forgot that the majority of Atari users are sitting behind native machines. BTW: I've installed NetBDSD on the clone and I'm not impressed at all... even a 060 can't really cut it. And that Lonny is why I'm against unix on this platform, almost all the apps can't be ported over because this platform lacks the necessary power. Bits and pieces may be good enough for you. But *if* I needed to use Linux for whatever reason I would install it on the mac, that computer has the necessary power.

Last but not least: the moving forward joke, one must be stupid, deaf and blind not to realise that we're not going forward at all, I would say that the last couple of years this platform has moved backwards. Coincidence or not, but that's about the period where commercial developers packed it in, and shareware developers were being ridiculized.
Your so-called moving forward song doesn't cut it anymore, the open source software that would come to the rescue hasn't materialized. And no matter how you twist and turn it, people don't really care about the OS, we all have one... what we need are applications and drivers. So yes, everytime when one starts babbling about moving on I get on my chair...

Cheers from Belgium
Dennis

Hi Didier,

>You can lost data if you don't know MagiC's bug. For example you havn't
>a system error if you delete a file open and not closed by another
>program.

Quite a while ago we had this very same discussion... I've just tried it again to be absolutely sure nothing changed in version 6.20. I've opened a text file and then tried to delete it.... all I get is an error from the desktop informing me that the file is in use and cannot be deleted. Opening that same *open* file with a different application isn't possible either... Unless I understood you incorrectly, I can't reproduce that "bug".

Cheers from Belgium

>If a list was taken as to who actually disrupts this group, quite alot
>of people would have identical lists. Everyone at the top of this list
>is also people who contribute zero back to the community. Sad really.

Contribute zero back? Chew on this mister gfa basic programmer:

You probably know it originates from Germany?
Rest assured, I did not translate the apps, you don't have to trash them.
But I would say that at least 50% of all the manuals and docs have been
translated by yours truly. In most of the printed stuff you'll see thanks
to DV for the translation in in the creditline. Who the hell d'you think
that DV is?

Reflect on this:
Considering that your knowledge of German is zilch, I put it to you that
if it wasn't for my work, you probably would be just one more bloke with
a powerfull tool that wouldn't have a clue how to extract the power and
make full use of it. Phrased differently: because of my contribution you
can work with gfa basic and the rest of the gfa apps, oh and I also took
care of a lot of omicron basic stuff, if it wasn't for people like me,
Derryck and Peter you would still be stuck with that wonderfull ST-Basic
and ST-Logo. My contribution ended where yours started, in a manner of
speaking you owe it all to me :-)

I've told you before to be a little more modest before you judge people
in here, You have absolutely no idea what some people here did and do for
this community. Just because they don't come in here bragging about it
doesn't mean they don't do anything.
Oh and another thing: before you put up you're show as mr know it all do
make sure you know who you're talking to, some 18 months ago you managed
to scare of one of the creators of the GFA stuff, that bloke has more
knowledge in his little toe then you in your whole body, knowledge where
you and others could have benefitted enormously from, he won't come back
in here....

4765. Re: Magic, MiNT, GPL?

Newsgroup: comp.sys.atari.st
Date: 2003-07-18 14:09:22 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1058545594-52715AEicMi@gmx.net>
Source record: 25349

From: Janez Valant <swe@atari.org>
Date: Thu, 17 Jul 2003 10:21:21 +0200

Hi Janez,

> What is Papyrus? Magic or MiNT app?

It's a TOS and MagiC application according to the docs supplied by ROM. As A matter of fact the word MiNT is not mentioned once. That doesn't mean that it won't work under MiNT ofcourse, but like almost all commercial developers ROM won't officially endorse it. Freeware, Shareware, Open Source or whatever standards are not supported, and if for some reason their software fails to perform adequately under MiNT, they're covered.
The only commercial app I've got here where MiNT is mentioned as compatible OS is Calamus, and only since version 99. And again, it doesn't mean that older version won't run properly, it just means that the developers cover their ass.

>I dont dislike fact that Emailer is commercial, i dislike fact its bonded to
>one OS only...

It isn't, it runs just fine under MiNT/N.AES since version 2.3

>Thats the problem. But on other side. thats problem of ASH. They could sell
>lotsa copies more.

That's bull, ASH is a software distributor, their main goal in life is to sell software, the more the better. You shouldn't be blaming them but the programmer, in this particular case however that's a bit difficult. It's the same guy who wrote iConnect...

>But i wont buy Emailer if i also need to buy Magic..

Like I just explained...
MagiC is not needed, under MiNT it will run just fine.

> Ah!, this is the first time you have publicly addmitted to theft. Who's
>> code did you steal?
>
>Where exactly Lonny said that? This is main problem, since u guys cant
>(wont) grasp that u MAY use GPLed code.. Thats legal way. Illegal way is
>reverse engineering..

He advised me to do some reverse engineering. It was only until Steve actually pointed it out that I realised he adviced me to go and steal someone's work !!
And then you are surprised that I'm upset? He even wants me to respect him !!

>Didier has done great work adopting the jpeg/mp3 (from mp123) into ASM/DSP and
>optimising it... And he didnt steal NOTHING. Ani would be a lot poorer without

>GPL, and also a lot worse, if Didier wouldnt do great job adopting and
>optimising the GPL code..

Has anyone ever suggested something different? No one is questioning Didier, on the contrary. But then Didier is a realistic person who knows the limitations set by the hardware. Aniplayer happens to run perfectly under both MagiC-PC and MagiC-Mac also, it's on these emulators that one can enjoy Aniplayer and the added goodies... And before you jump the gun: how low long does it take to convert an audio cd into mp3 files on a 060 clone, at what frame rate can you enjoy watching a DiVx movie on that same clone etc... sure it's possible, I can do it on a STF also, but is it acceptable?
And that's the core of the problem. I haven't got anything against GPL, but having to read claims here being made by people who sometimes forget that this is the Atari platform makes me just jump up and down. Why for example isn't there a port of for example Gimp or Mozilla? I'm sure that technically it's possible, according to Frederic it's just a matter of compiling the source... You know just as well as I do that these apps wouldn't run but at best only crawl forward on our hardware.
I think that I made it very clear that my post(ranting) was not against people using MiNT, I targetted the dreamers dreaming up dreams for other dreamers, and asked them to actually show something... as it happens these dreamers are using MiNT, it's not my fault that MagiC users obviously are more down to earth. Oh and I still haven't seen anything. Only Frederic managed to come up with a list, and as it happens, the only thing new to that list was an mp3 player, and as it happens, it only can run on one Atari computer, great we've all been waiting all these years just for this!!! and then you want me to believe in the slogan that we're moving on?
A long time ago I asked to someone who told me that we had to move on, in which direction, and added that his proposed route wasn't mine.... in a way it's sad but up until now, there's nothing showing me I was wrong.

Cheers from Belgium
Dennis

Reverse engineering is not stealing per se. Understanding how something
works is in the interest of knowledge.
COPYING a reverse-engineer derived process on the other hand is bad (and
illegal). In contrast SIMULATING the OUTCOME/OUTPUT of any process by
avoiding techniques (and technologies) that you discovered during reverse-
engineering of said process, is perfectly legal and why-not should be
encouraged.

Cheers

No I'am sorry... it's a bad test, because "Open file.." and "Close
file.." in the menu is different than Gemdos Fopen() and Fclose() OS
call.
If you load a file with Everest or Qed, the text editor Open the file
Read the file, and Close the file because the file is inside the memory.
If the file is modified when you select "Close file", the text editor
Create a file, Write the file and Close the file.
So a good test is for example to delete the file during a download on
the net. Or delete the file created by a spooler before printing is
finished. You obtain the "FATALER FEHLER IM GEMDOS!!!!", and sometimes
you crash all the partition. Under MiNT, I'am sorry because I'am not a
MiNT user, you cannot delete the file.

> desktop informing me that the file is in use and cannot be deleted. Opening
> that same *open* file with a different application isn't possible either...
> Unless I understood you incorrectly, I can't reproduce that "bug".

This bug not exist inside MagiCMac/PC because MagIC use not his
filesystem.

Regards,

Didier.

I agree they need to be covered and thus no mention of MiNT. Nothing is
wrong there. Same as many programmers, especialy on Falcon with
programmable Videl state they arent responsible for blownn up monitors
etc... But Calamus or Papyrus etc are just plain Atari applications. Write
one and break GEM etc rules while developing and it wont run on MiNT or
Magic.. Follow the rules, and it will run on MiNT, Magioc, Geneva,
MagicMAC/PC...

What i wanted to say is that there is no need to develop applications for
MiNT or Magic exclusively. Both are perfectly capable to coop with any
application which is clearly written. If u develop application cleanly,
acording to all GEM and programming rules, and u even newer saw MiNT or
Magic, application will work fine in both... Even if u develop in Magic and
use its resources, application will still work in MiNT or vice versa... U
may, ofcourse, use some patch in shape of wdialog etc, since MiNT and Magic
arent totaly equal, and thats i find good, not bad

>>I dont dislike fact that Emailer is commercial, i dislike fact its bonded

Well no need to jump emediately... I wanted to make a statement, why i dont like bonded apps... ASH or author, its not rally important, since its not my intention to bash anyone. Just want to point that application with modular inet acces (or anything else) is better aproach as fixed one. Usable in more OSes, can use more stacks etc.. And u can sell more copies.

>>But i wont buy Emailer if i also need to buy Magic..
>
> Like I just explained...
> MagiC is not needed, under MiNT it will run just fine.

As i said above it was an example. If i dont follow latest version etc i aplogoise, u realy mustn't see all as a threat. BTW, does that means Emailer now can use MiN/Net or Stik?

>>Where exactly Lonny said that? This is main problem, since u guys cant

> me to respect him !!

Hm as i saw things Lonny only said u have 2 options if u wana code mp3, ogg etc app, and those are GPL OR reverse engineering. Meaning that noone does those things from scratch, since there is no specs etc available. Thats also case with many devices, like scsi ethernet cards etc> hardware exist, but no specs, and drivers, even on unix are closed source so u cant get them... and no MiNT or Linux etc cant help if no sources... I have nvidia gfx card in pc, same there, no open sources, nvidia wont give away the specs, so clones etc, wont have nivida cards...

U wont like this, but there is hatery involved, thats why misunderstandings rise with every message....

> Has anyone ever suggested something different? No one is questioning

> added goodies...

Well of course u didnt question Didier. U did MiNT dev guys, calling them names etc... i just wanna make clear to ppl, that GPL and open sources are a must these days.. No company will develop anything new for Atari as platform, so programmers have to use open source, aka GPL. Point is, GPL and/or Unix sources doesnt mean death to Atari as platform, and Aniplayes is proof of that..

> And before you jump the gun: how low long does it take
> to convert an audio cd into mp3 files on a 060 clone, at what frame rate

Acceptable or not acceptable, its just matter of hardware. Useless on STF, semi usable on ct60, quite usable on ACP. With same software u just change machine, if are able of course.

> And that's the core of the problem. I haven't got anything against GPL,
> but having to read claims here being made by people who sometimes forget

> compiling the source... You know just as well as I do that these apps
> wouldn't run but at best only crawl forward on our hardware.

Of course i agree with that, anyone does. BUT, actualy it is just a matter of compiling the source. Ofcourse on TT or Falcon this is futile, but on CT60, thats more close to reality, and on ACP machine, Gimp or Mozzila will run happily. There is why we think MiNT is future. Not bacause its better as Magic, "better" is VERY relative word, but because its posibility to compile Unix sources.. Magic is good OS, with PC/Mac version give a lot on more powerfull systems. But it demand that new apps, like Mozzila or Gimp are totaly recoded, and noone will do that actualy. The bad point, from Atari point of view is that Gimp or Mozzila arent true Atari apps, but with rate of developing new apps, they are all we got sadly... On MiNT with Xgem, Unix GUI apps run in TOS window, so u dont need Xwins etc, u still can use genuine GEM envoirment with prefered apps, with some intruders... U dont loose anything with MiNT, no crippled TOS/GEM etc.. u only gain big library of Unix applications... Thats why i cant see where all that hatery comes from... I would understand that if we would using Linux.. only way to use GEM there are emus.. but MiNT is perfectly running native Atari apps, which makes u and me jumping up and down. If we can run Unix apps as bonus so much better. MagicPC/MAC users also run PC/MAC apps beside, and we dont go berserk.

U may rembember that Milan and Hades got Magic with a delay. It is harder to adopt Magic to new hardware, simple different option in GCC or patch is not enough. Magic is done in ASM, realy close to hardware, thus its benefits, but that also makes it less portable to new machines..

> I think that I made it very clear that my post(ranting) was not against

>to move on,in which direction, and added that his proposed route wasn't
>mine.... in away it's sad but up until now, there's nothing showing me I
>was wrong.

Well my above statement should atleast make u think. Its easy calculation: With Mint u can compile anything, which is useless on STs, a lot less usefull on TTs or Falcon's, will be quite usable on CT60 and almost perfectly usable on ACP (if we assume it will happen). Magic is not so open, benefits of that are speed and compact OS, smaller (a lot) memory usage, but expandability is harder. It can accept only real Atari programs.

Since there is not many developers, or close to zero, those realy are in great minority atm (apps in development) so for Gimp type of application there prolly is no developer :(Thats whats somehow put Magic behind MiNT if we consider future... And well thats probably path to go on. Im not exactly in heaven to run Gimp or XXX Unix app, but heck, new ones arrive slowly, or aka they not :(

Also, please do not blame MiNT for lack of developers, since MiNT doesnt push Atari toward exclusively Unix apps and scare developers away. Mint is perfectly happy with any Atari application, developers wanna preserve that at all cost. If they wouldnt, they would be morons, and they would develop already developed stuff: Linux m68k. Calamus run, papyrus run, jinnee run, etc, all apps runs.

To summarize: with new hardware, MiNT can offer many new apps, altough not real Atari apps simply by compiling them. And they can be run from within GEM (N.AES). If some new network protocol will pop up, MiNT Net can use compiled drivers and GEM apps via MiNT Net or Gluestik can use that. Magic dont allow that. Thats is important advantage, with future in mind. Magic can be run on G5, still we cant get new apps. Its not sad that we cant prove u that, its sad is that even in all that time, u deny to admit that.

> Oh and I still haven't seen anything. Only Frederic
> managed to come up with a list, and as it happens, the only thing new to
> that list was an mp3 player, and as it happens, it only can run on one
> Atari computer, great we've all been waiting all these years just for
> this!!!

Again u are damn rude... reason why mp3 only runs on falcon is not cause application is bad, but cause other Ataris are to weak. Please, dont twist those things. But if only look in Aniplayer, GPL gave us also lame encoder, ogg decoder, jpeg decoder (btw, i still prefer using Unix cjpeg/djpeg, not fastest, but very good results), open Divx, avcodec..

Reason why noone give u a list is that u shut that list down with "I DONT NEED THAT, SO ITS IRELEVANT" argument. Perosonaly i use cable modem for 6 years, 5 years i used TT as server (riebl card) on which i had plipped my main machine (Ct2 Falon) TT acted as ip masquarading machine, as ftp server and also as http server (apache). I know u dont like apache, u stated me that quite rude and clearly already, but i was and i am proud to have server on Atari machine, and it also feeded Falcon and a ST with inet access (proper acces, transparent..) Its not server for 100 ppl, but i did exchange data easily with my pals and it can handle 2-3 persons on http access. I must admit u were the onlz to react "i dont need that crap" other Atarians find it cool, altough i can admit its not some heavy duty server.. When im online it responds at http://yescrew.nocrew.org, but not much there...
I also used Knews as news reader, since on GEM ,there realy is no decent one, esp with nice threading etc. Here i want to stress that since i was using MiNT, i was using GEM and normal GEM apps like CAB, Aftp etc to acces internet, not some Unix apps. I took only benefits of riebl drivers,

internet stack and plip, ip masquarading etc drivers, unix apps, which resources can be used by GEM apps.

I dont really need many non internet related Unix stuff, thats right. I tried XV and find Smurf/Imagecopy better, ImageMagick was too slow. I did try to run Netscape, but via plip speed was to slow for decent work. I do use lotsa CLI apps, i love to use CLI, and there are many usefull things. like scripting, easy and less CPU demanding split/join as arj. I still like to use NFS for direct acces to files on PC or TT or remote server where i have page, for editing etc. I used mikmod to convert .mod files to mp3, guys who feed Nectarine, use it a lot. I still use lame mp3 encoder in cli, since it is less strain to CPU as Aniplayers encoder...

Those may not be reasons why u would use those apps, but fact is, they are usable and they are used. U wont ever hear me say let say Scripter, is crap and not mine way to future, just cause i dont feel any need for it. Actualy its one of things id like to see in N.AES.

Janez

P.S.: i answered in loong form, cause i wana people to understand my views, since u choose yourself as spokesman against world conspiracy against Magic etc.. Just a reminder, i have Magic installed on ST, works great and i also USE it, almost daily....

Ok, if that is the case I am wrong on that point. Sorry.

Also in response to Fred's specific mention to some features in MiNT that magic lacks, Dennis wrote them off as useless simply because he don't require them. Needless to say I now see the real source of the problem, it's not that Dennis is stupid, so I also take that back and again I was wrong. Sorry again.

I am not beyond stating when I am wrong. So Dennis if you read this please accept my apology.

Windows and even the amigaos have file locking, it's rather handy on a tasking OS, and reduces data corruption and file loss. Ok it's missing in magic, but it does not reduce magic's usefulness to Dennis at all, yet the replies are always in negative tone. Also he's ok with the mkisofs port since apparently that works fine directly under magic, yet is a gui-less text based port called from a GEM app.

The problem is he's terribly close minded, the idea that no one would ever want a feature or option beyond what he is familiar with is silly. Some people wish to do a lot more and this is where mint comes in, it has some modern features that take it to the next logical level, that's all. Why some people cannot simply accept that this option exists, and it's a valid choice is beyond me. In fact from what I read up to this point shows that Dennis makes judgement calls based primarily on his own personal use and preferences instead of actual feature comparisons. I now find him far too close minded to converse with, so it's back to the filtering and I will not come in here minus the fiters, that is my right as a usenet reader.

Sorry for the disruptions.

Have i got the right end of the stick

I've had HTML pages displayed in CAB and QED and being edited in JOE, saving the latest edit causes it to be redisplayed in CAB via the OLGA protocol, so that's 3 app's with links to this one open file?.

It is amazing how often the word "RARE" gets used, then next week the same item appears from someone else. It is the nature of the animal, anyone who goes to ebay without first doing some price research could be in for a rough ride, no doubt about it. I have found ebay to be useful at times, but at the same time I am very careful. Knowing when to pass on an item takes some effort sometimes.

I didn't ask for respect for myself, it was respect for mint.

Correct. Dennis as usual prefers to find fault in whatever I say before researching the topic. An example would be a network protocol that is not published. If you diss-assemble the app to obtain the protocol that probably is illegal. However, if you simply watch the data flowing in/out the port in question you can derive the protocol without violating a copyright. I thinks some of the chat protocols available on several platforms were documented in this manner.

I have a TT, that port is actually rs422 per the manual, since that is
what apple used at the time. Far as I know no apple talk software/driver
was ever made. That's about all I know about it, I never used the port
myself, instead I used the serial2 which is on the vme cover.

Interesting... which also means that taking your car apart to see how it works or taking a TOY apart to see how it works is illegal right (tell that to my daughter)? Also "disassembling ideas" ie breaking functional knowledge in a book to find how the writer thinks is illegal too right? Or maybe psychology is illegal too, because that's exactly what that does. By your accounts, doctors shouldn't be taught anatomy classes because it would be illegal? Maybe you still want to sit around Salem and burn witches but sure as heck the world doesn't. And don't give me lectures on how different it is coz it's not. Reverse engineering for the purpose of knowledge is protected by almost ANY patent law on Earth. TO USE your knowledge to make a duplicate of what you took apart is illegal.

P.S. It is what churches for centuries wanted us to do: "Believe and do not inquiry". Reverse engineer your faith to seek the truth for yourself is therefore illegal too and theft of the intellectual property of the XYZ Church right?

Come ON!

A skip? Isn't that what kids do? How'd you throw the Atari in that? ;)

> carefull there's bound to be a confrontation with two more soon...

As i said, one is criticising constrictively, other is calling MiNT developers loosers etc, u know what i mean, since all those guys are very skillfull programmers. U dont wana or arent able to recognize that. In NONE of our (as im MiNTer) posts i didnt saw someone said Kromke is looser, or bad programer etc.. i saw even some good remarks bout Magic and quite few i said...

>>None say programeras are being more as plain users..

> Oh, but then you've missed a post !

Yes i did. Reason is, ill be blunt, you and offendings by you... After a quite some time, first message i saw from you was frantic ranting, caling names, u hinted ppl of some MiNT vs whole world conspiracy....

> In this particular case it's the programmer telling the plain user that he
> deserves special treatment and looking back at previous postings it's not

> , you are absolutely right, people with such an attitude start me up. I do
> not accept such an attitude in the real world from anyone, so why should I
> accept it in here?

U shouldnt. But u should start with yourself... In my book there is no lousy coders. There are coders and noncoders. Period. Without being unrespectfull to noncoders!! Iwe got many hints when showing my betas arround. And also one in your style, and to him i didnt stay polite... There is little worse for a coder as ranting noncoder spitting poison and accuse skilled ppl half programmers, loosers etc. U are entitled to say what u dont like, what ud like in certain app.. But do not accuse ppl etc, judging its skill, if u dont understant stuff..

> As for the bashing and insults: Lonny started it for whatever reason, I've

> This is not a mailing list where he's in full control.

As i see it, its mailing list where u want full control... To bash who u dislike (no matter if u doint realy know its skills), save world from MiNTers conspiracy, etc... U may have quarrel with Lonny, but that still doesnt give the right to bash his code, or work. I know his programs arent bad, he also does a lot to revive GFA (upon which original coders gave up) I real am interested by what criteria u know GFA coder (u realy think Lonny scared him off, after his years of inactivity? please, common...) know more in small finger as Lonny?

>>As long that is not the case of Dennis/Steve, which realy is insulting,
>>and bashing and hatery...
>

> costs.

But u see, i never siad u didnt help ppl, or that u make selection... But on other hand u are arbiter here, who is good coder, who is looser coder, which way is good and which isnt. Sorry i cant realy accept that. Argue with Lonny or me or anyone bout MiNT/Magic prefs etc, but dont start to insult anyone, declaring him bad coder etc, i wont repeat all bad words here... espcialy if u arent better coder

> If somebody here has a hardware problem and it so happens that I happen to

No problem... But u see, if i would make remark as Lonny did (i think) or evem more likely someone other, bout best USB card (and im sure there are bad and good ones) u wouldnt react in such inpolite way.. and in your wisdom above all, declaring him moron etc.. and then u wonder to get similar responds....

> Someone who shall remain anonymous mailed me last week accusing me of

> author, so I can comfort myself at least knowing that whatever I messed up
> had their blessing.

It was me, i admit. I also admit it may be to hars and use this chance to apologise. However, your ranting and again declaring lotsa good and VERY hardworking coders, for our platform, lousy coders, and so on, no need for me to repeat, make me angry.. a lot. Being MiNT free or no free it isnt a matter. Even if u feel (and thats part i realy somehow cant forgive you, since u twist words wery well and somep ppl may believe..) its step back for Atari and spliting the scene, they do work HARD. Fact that they do that for free, is again sign for u, that they are lousy coders, but infact they dont code for money, or fame, but for the Atari... And i really felt that writting bad application is still more valuable as then translating it... You wont hear me bashing you or any translator, calling u moron etc, if ill find some bad translations. I dont wana deny any translator here, u doing good work, but apart from you, i also dont here other to bark on others... Thus private mail...

> Have you any idea how difficult it is to produce a "good" translation? One

> have to translate the program but also test every feature out.... You have
> no idea how many bugs me and Derryck found in countless apps which
> otherwise would have slipped through unnoticed.

I know very well how hard translation may be... I did few apps myself, most of them non gem and im perfectly aware how it would be to translate them. I also did some cracking, and translating myself too, mainly for personal usage...
Thats exactly the reason i never rant about! But do u know how much work is to say specificly, needed to make application like AtariIRC, or MiNT kernel, or Magic kernel? Id say u must know exactly, since u are so good to

bash some coders...

> English speaking community to enjoy the apps... have you any idea how many
> little German jewels there are out there? Unknown to the English community
> because they never were translated?

Yes i do actualy. I have many apps and try all i can get, but since
neither german or english or spanish or french is my native language, and i
only learned english, i had to learn german, since we got german STs here..
So my desk is multiligual. I even used Avant vector which is in Norwegian.
And i must admit i do pitty all german/uk users, who choose not to learn
those few german/uk words and rather ban the application. On other hand,
authors could realy did multilingual apps, since easiest way is to do that
while coding...

> A couple of years ago Derryck and me joined forces an D&D translations

> that almost 80% of software originating from Germany has passed through
> the hands of Peter, Derryck or me.

Well my desktop programm does speak german to me... And not just desktop.
As i said, i dont realy care the language, altough french make me some
troubles :) But also as i said, MiNT developers also spend all its own free
time, same as u they dont charge, MiNT is very much progressed, its realy
way back from clumsy Multitos or early kernels, but that doesnt stopu
bashin them, calling dreamers, etc i wont repeat all that.. and then single
mail got thru to you... U maybe now can imagine what your posts do as well?

> Every avid Calamus user should thank Peter and Derryck on his bended knees

> Calamus & modules, not to mention the manuals, no one can grasp what has
> passed through Peter, Derryck and my hands the last 10 years. We don't
> come bragging about it in here or anywhere else for that matter, after all
> we don't create anything, we just mess up others their work...

What can i say. I can make u snapshoot of mine Calamus version, its in
german.... I also bought NeoN and also fight with German docs, but hey, u
learn German once, not for every app
And by now u may understand what i meant with "messing with others work"

It means its easier to translate application, as to create it. Messages and text is very small portion of an complex thing named programm. Also it was private mail, sent exclusively to you, since u rant and use a LOT harder words as i did for programmers, who also spent all their free time coding, creating docs etc etc... Fact that u insult never stopped you... Im not in class of Kromke, or Naumann, but i do also fit in those loosers, halfcoders etc category of you....

> Where does Steve fit in?

> their views on what Steve does for this community.... you'll find out that
> not everyone their opinion of Steve outside usenet is so low, that they
> can't even pronounce the words...

And that gives him right to spit on all he dislike. or think he dislike, or if they happen to did software he dislike?

In early discussions, more as year ago, u named me names etc too, yet u dont have a clue if i did help others, or how much i did etc.. No need to count me what Steve did, explain me what gives u and him right to insult ppl? And by that i mean heavy insulys. While Derrick is quiet.. Derrick was the reason i didnt answer oh his post, that u do translate stuff etc, since i dont have any quarrels with him..

> Oh and one more issue before I end this yet again long post:

> they haven't shown that I'm wrong. *nothing* essential has materialized
> yet from that part of the woods...

Well yes it is quiet... or maybe not. There is ACE, great application from NewBeat. I know its Falcon only sadly, main reason is skipping of Milan2. I know the author good, and he had ACE on hold in favour to GEM version on Milan2 and Deesee, but then he need to make Falcon version. Before u rant,

application is a true coding gem.. He has long awaited game in pipeline too, and there are some other projects too, going slow, but it seems its going.. Those guys same as ACE author are excellent coders, ommited by one fact: Hades is expensive. So they code on Falcons, since it has some resources which allows powerfull apps to be done. With apperance of CT60 that will even grow. There is no Hades/clone hatery involved.. And they do drag nearly imposible things from Falcon... esp being loosers...

But MiNT definately is not quilty for that, since all those apps we have , all new ones and the ones in work do work in MiNT too. Fact that there is not more from GPL fans is quite normal: we have weak machines. MagicMAC is powerfull i agree, but bonded totalt to clean GEM apps. Hope for us, open source fans is CT60 and lately ACP. With MiNT as os, u can then just compile let say Gimp, and CF on 200mhz+ should be enough... For same machine, Magic need patch, or maybe even rewriting, and u still are stucked with existing apps. Beauty of MiNT as i said in other message as well, is that GEM is still native OS and run all native (atari apps) in 1st place... Unix CLI is a bonus, and X apps run inside GEM in window. MiNT is not instant move on... But even on ct2 or TT, there are many apps from Unix, which can fill some holes in Atari scene (network, cjpef/djpeg, i use knews..) but real "brake" is hardware as Unix apps cant be compared with native Atari apps in terms of optimisation etc...

And u keep denying and ignoring that fact. Noone ever said, MiNT will make TT out from ST, or enabled Gimp etc on Falcon... But we do say its already capable of compiling and running those apps, maybe with small modifs.. at realy slow speed... But all we need is better hardware and those apps will be ready to run. Converting 100000s lines of let say Gimp to GEM app is task noone will do...

Janez

P.S. Also long reply, i applogize to all... I read some further messages, seeing lotsa bad words again, so i may stop nagging u all here again.. I dont see a point in all this....

Actualy guys, it is. I have v 6.5 compiled, recent one is 7.0x actualy.
Was compiled in 2001 actualy, but there is no reason 7.0x wouldnt compile.
On falcon is preety slowish, but on Ct60 will be quite usable. Im ready to
make u a snapshoot of GhostView in GEM window, if u dont believe me...

Hi swe,

Whatever you do, don't leave again just because a specific user or
two can't see the usefulness of a compiler. The real problems are
denial and changing times. This platform has crossed over that
commercial point where certain things just are not going to happen.
Dennis would probably be perfectly happy with a full GEM rewrite of
PINE from the ground up if it ran directly under magic. If you carefully
read most of the posts lately you see a trend along those lines. The
problem is this sort of effort, although a nice idea, will probably never
happen. Dennis is clearly unwilling to compile stuff, that is also his
right and I understand why many would want to avoid that. The constant
negative tone associated with it is annoying however, people have to
understand that since the commercial end is about nil, the direction is
going to shift to this open source concept, like it or not. There is no
other direction to go unless you want to wait forever for a GEM app that
most likely will never come to exist, or sell your Atari and find a new
platform. The other option is to become a coder. This open source trend
keeps people using the platform needless to say. It's to bad certain people
cannot respect that, or consider it a valid option for this platform.

I was not always a mint user either, I tried that path with STiK for quite
awhile trying to avoid any an all things associated with mint. I didn't
want to deal with compilers either or strange setup issues. Magic came
along, but I heard too my horror stories directly from friends who lost
entire partitions, and after many conversations with people on IRC
I went with MiNT. You can be a MiNT user and never touch a compiler
if one is willing to wait for someone else to make the binaries, they

eventually surface somewhere.

As I said in a previous post I don't think Dennis is stupid, I had came to the wrong conclusion. He prefers to think of this group as comp.sys.world.according.to.dennis and shoots down anything that's outside that. That's fine for him I guess, I won't wait forever for such apps and I'm very thankful that the people who make these ports do what they do. You can't help someone who wears blinders.

I also would not tell some to switch to mint. I don't advocate switching unless you actually have a really good reason either. My only wish is that Dennis could find it in his heart to say something positive or nothing at all, rather than hit every post that menitons MiNT with a negative reply. Or worse yet, making fun of the hardware one uses.

We seem to be stuck with Newsie in a froze state of development, that is too bad, it really needs filters. I would just be more selective in what you read from now on. :o)

Dennis,
I just wanted to say my peace on this topic. In an earlier thread you mentioned about all the help you have given people over the years. I for one would like to thank you for that!!!! :-) I cannot count the times I have asked if there is a freeware or shareware or demo version of something that would solve a software problem I was having. You have always come to the rescue for me and I am sure MANY, MANY others. I have not dealt with you, with respects to hardware. But my dealings with you on software issues over the years would lead me to believe that you would treat hardware NO differently. I also know from other dealings that you would NOT ASK FOR ONE RED PENNY. So from the bottom of my heart I thank you for all of your help over the years and definetly a big thank you should go out to DDP for all there efforts in translating issues.

Now for everyone else,
I dont know where some of you get off saying that Dennis in particular has done nothing for the Atari community over the years. As his post said earlier, he has done translating for many years. Far longer than I have known him, but he admitted that some of his earlier work was not his best. Which is OK, because people learn as they go and become better coders as the years go on. I believe Dennis has done his fair share of contributing to the Atari community. As for Magic, Mint and open source battles. I for one prefer Magic with Jinnee. I have thought about installing Mint BUT that is as far as it went. I like someone else who posted earlier who said he had problems with Magic had heard the opposite about MINT. That there were issues with MINT that make it not the best OS to use. Not to mention I have heard that it does not feel like it is a fast OS on a Falcon030. If someone can prove to me that MINT has far superior looks and options all contained in a great looking GUI that is easy use and setup than I might be interested. But I have seen nothing that proposes that MINT is a superior OS to Magic with Jinnee. Hey, LONNY was you using Jinnee 2.5 with your version of Magic??? What version of Magic was you using??? Give up some web-

sites with information and pics that show that MINT is superior and is constantly improving there OS and I might become a believer. But I, like Dennis, feel that MINT has not changed enough recently to consider any of the minor improvements a must for me to rush out and get the latest version and install it on my computer. I might be wrong and way off base but just my two cents on this whole issue!!!!!

Thanks,

I don't use magic or jinnee. The file locking I find to be critical, and a couple of other things. Looks are subjective as well as speed to some degree. If someone wants to do more than sit and post msg's here, such as run a web server, where security and permissions and such become critical issues, then yeah stick with magic. Nobody is saying to switch, the only thing that annoys me is people writing off these more advanced options as worthless simply because they find that feature useless.
Some run memory protection at all times, why? It makes the machine even more stable, but apparently it's not viewed that way here.
I have used mint for some years now, even on my TT and have found it to be very stable. In fact the only prgs that refuse to work are those from ASH, except for CAB. It seems typical, I am expected to provide information, when you have the entire internet at your finger tips? I have researched magic, I know the features and if I had relied on the information here I would of been severely misled. Please research MiNT on your own, I don't have time to do other peoples leg work. If you don't know the features then silence is a good alternative.

As for contributing, yes I apologized to Dennis in some other post. Speaking of which I have released a GFA library for accessing the PCI bios on the clones. Again, contributing as well and my motivation is of course usb for the clones. The majority of the world has usb via a PCI card plugged into there PC, but according to Dennis that is a bullshit idea. Even if he might benefit from it down the road. I have never shot down any of his ideas in such a manner, if I did please point me to the exact post.

You didn't read Dennis's reply to Fred about file locking and memory protection very carefully then did you? Every modern OS has it, but magic. Do you really agree that a reply like "who cares I don't need it" is really a good reply? Do you think everybody has the same exact needs as Dennis or yourself?

Hi Rob!

R>1) Can it simply be done by getting a cable and plugging into the lan
R>ports on both machines... What software would be required

It's just a serial port with a different connector. You can use kinda
null-modem cable to link the two computers, and then use a terminal program
like connect or starcall to transfer files.

I've tried it with my two falcons, and set up STinG to route IP packet over
that conection. Works, but not very fast/reliable as IIRC some hardware
handshake line is missing.

With best regards
Ekkehard

ill explain u where: He is/was very rude to ppl with diferent opinions, call mint dev guys looser programers, bad ones, minters also lamers, since we got no scsi eth etc drivers to show (we cantm since those are closed source) etc, i realy dont wana repeat that he is abusive and very rude toward ppl who actualy create something on platform. Since that creation is something he does not need, or find useless, he call them bad programmers, bla bla, very very insulting infact.. Now correct me if im wrong, but creating new apps, os, or developing existing ones, give us more as translations of already done apps. That is actualy a stagnation. To Derrick and others: I dont wana deny the work and importance of your work, but that dont give one a right to spit all others work...

> As for Magic, Mint and open source battles. I for
> one prefer Magic with Jinnee. I have thought about

> problems with Magic had heard the opposite about MINT.

U see its nothing wrong with that. Im MiNTer, and i do use Magic on MegaST, because on lowmem and weaker CPU Magic is unbeatable. Ill be the first to admit that if needed. I do use v3, since ram usage is cruicial for me...

> That there were issues with MINT that make it not the

> does not feel like it is a fast OS on a Falcon030. If
> someone can prove to me that MINT has far superior
> looks and options all contained in a great looking GUI
> that is easy use and setup than I might be interested.

Easy. MiNTs AES (N.AES) and Magic AES are infact very similar ones. Magic one is closer to machine, nas already speeded up VDI so it redraws faster. N.AES require NVDI, but on both OSes NVDI is kinda must anyway. But indeed

generaly Magic is faster. (when ill say MiNt i actualy think on N.AES) Full MiNT also from startup has more processes etc opened. Things changes when u open more harder tasks at once... MiNT behave better, and since it has dynamic prioritsation, u can even change each process priorities if u dont need some bacground process is fastest, in favour of foreground applications... For example, if u make some mp3 and u dont care it it takes 3 or 4h, u can lower encoder priorities and rest of the system will hardly notice it..Those are some of basic differences if u use MiNT in what we say "MuliTOS mode", which is kernel and N.AES only. Also u can use only MiNT kernel, no N.AES, and ull actualy boot in TOS, which is fast, but not mtasking AES. Benefit it u can acces minix or ext2 partitons etc, asince MiNt is active and u can use its loadable devices, ramdisks etc...

Adding Unix envoirment is strongest point of MiNT. That means u can use Unix CLI, Unix internet stack and services (like http server, ftp server, nfs, u can use Atari as fully working server - as i did TT for many years, it allowed me to acces internet via cable modem years ago - exotic pic converters, many digital cam firmwares etc..) Again, i must repeat. N.AES stays, and it is main GUI and run native apps, whuch can use those Unix resources as well. With XGem u can run X applications in N.AES in GEM window, so merging of Unix and TOS/GEM as it best. Incase u have PC at home with Linux/BDS/etc, u can run applications like Netscape on it, but set that all display etc is done on XGem and Atari (require ethernet and fast connection though) I succed to run Netscape that way, VLC movie player, Frozen-Bubble game, Gimp 1.x, 1.3 dont work properly etc.. ill be honest, VLC plays at 2-3 fps, Gimp as well isnt exactly usable, Frozen buble almost is playable, but that was on Falcon, with not to fast connection (which is crucial for this type of work)

There is realy a lot of possibility, and apps etc to be used, a LOT of CLI tools, less GUI, since Falcons or TTs are a tad slow. Also the thing we find most important in those days, lacking developers, is gcc. Since MiNT has progressed a lot, had got proper and modern Unix structure, all main libs (even gtk+) possibility of compiling is tempting. I fully agree with Dennis, that mozilla or gimp will be to slow, but we only need new hardware (Ct60 in pipe, ACP project alive...) and we can use those apps. I wil again be honest and must admit Xgem does fail on some of apps (latest Gimp 1.3 beta) but its a matter of updating it. OSes like Magic or TOS etc, would require rewriting of apps to GEM standards, if using interner also to Iconnect or Stik stack... and since those apps sources are tens or hundreds of MBytes, its very unilikely some will start that...

And bout look: that is very subjective and since i already told that N.AES or Magics AES arent much diferent at all, it depends of desktop, and MiNT with Jinnee realy dont behave much different as Magic.. Minor diferences are for example that in N.AES u fade window with right button, in Magic with double click etc.. U can for example also using Thing in Magic.. I did that when using Magic on Falcon, because u realy like Things groups...

To avoid arguing: im not saying Magic is bad, its actualy little gem, with few a bit nasty bugs, but heck any complex app has them. It perform truly

great on lowspecs machines, perform good on beter ones as well and on PC/MAC. Problem is it its "closeness" which prolly derive from lotsa optimisatioins, to make it work realy good on plain Ataris. ST or Falcon with Magic is super speeder compared to Amiga 1200 without accelerator... I just list some of advantages MiNT has. A bit slower respoond, bigger RAM usage (i ALWAYS advice Magic to ppl asking me bout MiNT if they arent Unix fans and have 1/14mb machines) are necessary evil of those advantages. Biggest advantage for platform is still in mz opninion, instant acces to new apps via GCC on new hardware, no matter if thats 060 or ColdFire or PPC while all native apps still runs. Fact that those apps arent native is not what i particulary like, but thats other problem. Personaly i enjoy MUCH more on MiNT/N.AES with native and "imported" apps, like if id have to migrate to Linux or Windows...

And by no means i force someone to change OS. All i want is honest evaluation of those specs and hopefully someone will admit there are advantages and good things in MiNTs aproach...

> But I have seen nothing that proposes that MINT is a
> superior OS to Magic with Jinnee. Hey, LONNY was you
> using Jinnee 2.5 with your version of Magic??? What
> version of Magic was you using??? Give up some web-

> might become a believer.

I can provide u snapshoots of my desktop... Working picture, not some fancy fitted desktop. I also have made torture.jpg, to show how MiNT handle heavy cpu tasks (runing gemdemo, mp2 player, avi movie, desktop, 3 consoles, on ftp going... at same time, with still decent fps count and responsive system)

About MiNT develooment u just need to check sparemint website at "http://sparemint.atariforge.net/sparemint/" There u can check all packages available in RPM form (easy installing) and also u can check how developing is going at "http://sparemint.atariforge.net/cvs/ChangeLog.freemint" On our pages there is Magic vs MiNT comparisment, u can check it at "yescrew.atari.org" in MiNT section...

Fell free to ask for snaps, email will do i guess?

> But I, like Dennis, feel
> that MINT has not changed enough recently to consider
> any of the minor improvements a must for me to rush
> out and get the latest version and install it on my
> computer. I might be wrong and way off base but just
> my two cents on this whole issue!!!!!

Well i really dont think all counted are a minor improvement... Also in link to ChangeLog ull see at what rate developing is going on...

And on end, please do not respond that since u dont need those apps and stuff, ppl which doing that are loosers etc.. I am and other MiNTers are

too, perfectly happy with any OS one choose to use (i even spent DAYS to track me a bug in GGT2 since few ppl had probs in Magic). I just ask for open minded aproach and some acknowledgment for HARD working ppl who develop MiNT. They are without doubt real Atarians, and they choosed the Unix merging path is right one, no need to blame anyone for that....

Janez

Hmm this all sounds very interesting could we make a mailing-list of people that get these systems by donation.
We could publish a list of what people have and maybe can exhange them. Like I know the Atari 810 drive is very common in the US but not so in Europe and Czech. In Czech the turbo-2000 XC12 cassette is very common but not in Europe and the US....

Just a small list and people contact each other by e-mail. I think the items being exchanged must NOT be sold the only money that could be asked is for the shipping-cost to someone else...

Let me know who is interested. We can setup a list.

>I also would not tell some to switch to mint. I don't advocate
>switching unless you actually have a really good reason either.

Do you mean that you've had a change of heart all of a sudden? Less then
a year ago Frederic Fouchet announced here that all MagiC users are
retarded morons, the only guy supporting that view (publicly) were you.
IIRC I even nominated you for a award...

>>Or worse yet, making fun of the hardware one uses.
>
Excuse me?
When did I ever make fun of the hardware one uses here? IIRC we had more
or less the same views about support for hardware with anything less then
a 68030 should come to and end. Other then that I've always supported the
ancient hardware and people using it. If we like it or not the majority
of Atari users are still behind those computers. The number of Falcon, TT
Milan and Hades users put together still forms a minority.

I would really like to see that post where I make fun of the hardware one
uses... I'm convinced I've never wrote anthing like that. In almost every
discussion I hammer on the fact that this platform is more than just
clones and upgraded Falcons and that developers should take this in
account. I have 68000, 68030, 68060 and G4 based computers here, if I
would have made fun with someones hardware, then I would have been
ridiculising myself also.

>My only wish is that Dennis could find it in his heart to say something
>positive or nothing at all, rather than hit every post that menitons
>MiNT with a negative reply.

A week ago you stated here that you've studied my previous postings on
Google, surely you must have noticed that most of the times I reply to
insulting or provoking post?
Next time you do a search on Google, look at all the MiNT-MagiC related
drivel you've posted in the last 12 months... the shoe fits on your foot
just as nicely as it does on mine. And thanks to Google anyone can see
for himself who the provokers are and who reacts to provocations. I'm
convinced that anyone with an objective view will see that in almost all
wars and discussions here the MagiC users were made ridiculous in one way
or the other by some MiNT users.... Note that I wrote "some" Mint users,
I know very well that the majority of people using MiNT find these wars
and discussions silly and a waste of time, just like the majority of
MagiC users don't really care...

Oh and if you look hard enough on Google you'll see that on occasions I happen to say positive things about MiNT. The problem is that a lot of people don't read posts completely, they just seem to read whatever suits them and skip the rest, others even interprete my posts and put words in my mouth which I've never spoken out loud...

So once again: I do not hate MiNT nor the people using it, I did say many times that it's being let down by a lousy AES. And I know very well that almost all applications which run under TOS or MagiC run just as good on MiNT. I also know that thanks to MinTNet people with a cable modem can use it on this platform. I don't happen to like the MiNTNet clients very much and never made a secret about it, IMO nothing beats the ASH clients, but once again that's strictly my own opinion. When someone thinks he has to have a go at these I react.... is that so difficult to understand? A couple of years ago I didn't need to come forward in the spotlight every time, there were others here fighting the holy war. Nowadays however it seems that I'm about the only one left who raises a voice when things once again get out of hand... I suppose that automatically qualifies me as the "bad" one, so be it.
If someone here comes advocating ported software, you can safely bet your money on it that it won't be long before I jump in as well. It's not the fact that it originates from unix or open source that bothers me, it's simply the fact that this kind of software either only runs under MiNT which doesn't qualify as Atari software to begin with IMHO. But on top of that most of this software also doesn't come with the look and feel that sets Atari software apart from others. So yes, everytime someone comes here telling us that once again something beautifull has been ported over, I climb the barricades. And some MiNT users don't like that and take offence.... they seem to forget that whenever a new application is released on this platform it's usually openly dicussed in this group. So why is it allright to criticize for example Porthos, Calamus, Papyrus, Draconis or PhotoTip and sometimes break it down to the ground while on the other hand if one comes forward and gives his honest opinion about a ported application hell breaks loose? I'm allowed to say that CAB is crap but shouldn't say that "xxx" belongs in the same category? Sorry, I don't dance to that tune of music.
If something is good I'll say it also, Anodyne has ported over mkisofs2, and went through the trouble of giving it a GEM front and addition it runs on the three major used OS's... if all the ported stuff would be like this, then you wouldn't have any problems with me. Unfortunately that's not the case...

In a different thread Maurits and Frederic are telling me to be realistic and look at the succes of Linux, Martin has also told me more or less the same thing a couple of days ago. OK, I'm not blind but I'm not completely stupid either... Linux is getting more and popular these days because it has finally entered the 21st century. Joe Average can now install it with a couple of mouse clicks on his Joe average computer. And once it's up and running just like with any other modern OS he can enjoy using the apps running in a multitude of windows, entering commands from the windows menu's... the chances that he'll ever will see a CLI are minimal. He's

not expected to even know how to open up the terminal window anymore, as far as that Joe Average is concerned, that fresh installed Linux is just a nice MS Windows replacement with apps that even have the same look and feel....
Now let's warp back to this platform, the stuff that is ported over doesn't run in a nice GEM window, it's unaware of any long established protocols that sets Atari software apart from others, and furthermore it's usally tied to running exclusively on one OS. So yes, I complain against these ports. I consider myself to be Joe Atari average, running Joe Atari average applications. And I happen to like these Joe Atari average apps, and I like using them so much that until this very day I haven't switched platforms. I'm convinced that anyone reading this more or less recognises himself in this small description.... bear with me, I'm not finished yet... Being just that simple Joe Atari average guy I can't understand why all of a sudden people want me to switch from OS, feeling great about running "alien" applications that bear no resemblance to all these great apps and utilities that I've been using for the last decade. So Joe Atari average is really confused, he doesn't really want to give up working with the OS he knows through and through and has never really let him down. The very first thing he has to do is to install a free OS... it's sounds simple enough, but unlike with his previous OS that installed from a couple diskettes, he needs to go hunting on internet for all kind of weird called apps... why on earth that there isn't a package available which contains all the stuff he needs (kernel, AES, desktop application etc...) with an easy to install installation program is beyond him. And he knows that there is a very easy to use freeware GEM installer available... he asked the question once in a newsgroup and was told that installation programs are for sissies and that setting up a complete fullblown MiNT is kidstuff.... it took him weeks to set the whole lot up, but he persevered. So now he has moved forward and is really up to date, most of the apps he loves working with still run although some look a bit weird, he has a couple of utilities which happen to hangup the computer and force him to reboot, but in the newsgroup he's told that these are dirty hacks and to get rid of them.

to be continued.... (I've ran out of time, sorry)

Cheers from Belgium
Dennis

>If you load a file with Everest or Qed, the text editor Open the file
>Read the file, and Close the file because the file is inside the memory.
>If the file is modified when you select "Close file", the text editor
>Create a file, Write the file and Close the file.

That makes sense, but if the file is actually closed once it's loaded in memory then one should be able to delete it safely, in this case it's not possible because the desktop prevents it: "file in use". And like Steve mentioned that text file could be in use at the same moment by several OLGA clients, so even if the text editor closes it, it could be opened a split second later by a different program... what it boils down to is that in normal situations, the user can not accidently delete the file, meaning that in practice the file although not locked is just as safe as it is under MiNT.

>So a good test is for example to delete the file during a download on
>the net. Or delete the file created by a spooler before printing is
>finished. You obtain the "FATALER FEHLER IM GEMDOS!!!!", and sometimes
>you crash all the partition. Under MiNT, I'am sorry because I'am not a
>MiNT user, you cannot delete the file.

That makes sense as well. But then one really must be stupid to delete a file which is in use. Anyway the described scenario won't happen here, I use a dynamic Ramdisk for temporary files from spoolers, same thing for downloads and uploads. Using a ramdisk for such tasks saves the hard disk a little and in addition is also very fast.In the worst possible scenario all I would delete is an alias.

Cheers from Belgium
Dennis

Hi,

>Reverse engineering for the purpose of knowledge is protected by almost
>ANY patent law on Earth. TO USE your knowledge to make a duplicate of
>what you took apart is illegal.

It sounds logical enough, but what for example if you agreed to the user licence which explicitly forbids you to reverse engineer the software?

There's actually a rather big bobo at the British patent office among us in this group, Bill if you read this would you jump in and explain it to us (in plain English please) ?

Cheers from Belgium
Dennis

Hi Dennis
These clauses on licenses are illegal usually (unless protected under a certain category ie. National Security) as they are unfair (as in fair use which does not refer to the reverse engineering process as a term but it is very close in concept of knowledge use)

Dennis,
Just wanted to make sure that you got my e-mail from
this last Tuesday dated 7/15/03. It might have come
into your server on 7/16/03 because I sent it around
9:15 or so. Just let me know via e-mail and if I dont
respond back say something in this thread. Just
wanting to make sure that our e-mails are getting back
and forth once agian.

Thanks,

Well, though I dont agree with this policy myself (nor do I care), its commonly accepted that binaries are not allowed to be posted to non-binary ng's. So although I dont care, you will probably get some more (un)deserved slaggings....

Like, "that pic was 270K you slaphead!" :P

Smeg.

> how it looks like, upload the compiled ready to run Ghostscript 6.5.

Answer is easy: complete rpm package, with man pages, docs proper structire and actualy a ted more recent is on SpareMiNT pages. All one need to do (cause many ppl dont feel comfortable with compiling etc) is to browse that page, dl ghostscript rpm file and type "rpm -ivh name.rpm" In few secs, rpm is installed on proper paths, with man pages etc and ready ro run. Also u can install any MiNT (cli or gui) application on *.pdf in desktop, so all u ned to do is dclicking .pdf and ghostview will be started. Of course, u need to habe XGEM active... (and u can load it or exit in demand). I will repeat, that its not really to much usable on Falcon. since its rather slow. It is an option if there is pdf u REALY must see and native viewers fails etc... or if u have 060...

I realy advise u or ppl interested in MiNT to check SparMiNT pages. There are TONS of ported software, all in .rpm form to allow easy installing/deinstalling/upgrade. In a way, installing rpm is easier as installing GEM application, no paths etc are asked, since Unixes folow exact folder structure. (user may use own paths, but public packages for XXX distro, are standardized). And afaik, there also is GEM interface for rpm application.

Packages are sorted alphabeticaly or thematicaly. U will see, that MiNTers dont just talk, but also port stuff, a lot of it... SpareMiNT solves what was main MiNT problem, which were messy ports, non standard paths etc... And also ppl dont need to run gcc, or even install/update it, since compiled packakes, rpm's, are soon or later available. Rpm's also means, application is fully acceptable and full, menaing it came with docs etc, proper pathes etc since that is checked.

And for end, a link: http://sparemint.atariforge.net/sparemint/

>BTW: why on earth did you keep this ready to run app 2 years hidden from
>this community you happen to love so much?

Well i didnt hide anything. We keep repeating that SpareMiNT has all those packeges, ported already, so user can easily live and use software without ever runing GCC, but that never came thru... U keep repeating that u want to see all those app, we keep saying that they are on SpareMiNT, but noone bother to check if thats true... Fact was, those apps were a dream and MiNTers conspiracy.

Spare MiNT is what MiNT as os really needed: Standardized Unix filesytem and structure, and rpm packages, which contains apps, packed exactly according to Spare MiNT standards, so they install cleanly and with all required things, as docs, libs, manual pages... Porting X app isnt so easy, it involve compiling the app, collecting required manuals etc and pack all in valid rpm file... Glimps on SpareMiNT archives will convince you that those people realy are serious about their work and that MiNT really is way ahead of being some kind of "cowboy" OS as its widely accepted "fact".

Dont be so sure... I dont consider myself to be idiot, but i did
accidentaly delete files... Also if i remember, under Magic u could delete
application's (in use) folder which also lead to crash. It wasnt latest
Magic though, so i dont know if its fixed in 6.xx.

I dont post this as laughter about Magic, but as reminder, what u never
must do... Even if its not fatal or its fixed, its smart to take
precautions...
Same like u never should switch off Unix/MiNT, if u use large disk caches
and fsystem is not synced.. u may lost some data, altough not partiton,
luckily. So its necessary to shutdown properly...

Janez

If by "it" you mean "reverse engineering," then your interpretation is rather extreme. My understanding is that reverse engineering is explicitly protected as a sort of fair use in many European countries. AFAIK, reverse engineering isn't protected as explicitly in the United States, but it's still legal in many situations. For instance, various companies reverse engineered IBM's original x86 BIOS back in the mid-1980s, and this practice was found to be legal. (I believe there were court cases, and some practices were found to be illegal, but others were OK. My memory of the details is foggy, though.) Of course, you might sign a contract that forbids reverse engineering, but that doesn't make it theft if you violate that contract term; it becomes a contract violation. Note also that the legal validity of "shrink-wrap licenses" in restricting practices such as reverse engineering is uncertain at best. There have been few court cases dealing with these "licenses," and the outcomes have been varied -- some have said that the "licenses" were legally binding, but others have come to the opposite conclusion.

THANK YOU Ron,
and yes your memory serves you well. As for the licenses they were all
deemed illegal in Europe.
As for the US, the UCC renders a contract null and void (exact term) if
it's terms are in violation of laws. Just because no one brought action
against you-know-who doesn't mean that their practices are legal.
And if you don't believe me, read Cheesman's Intro to Business Law (taught
in most business colleges in the US)

I respect your taste and prefered applications. Thats totaly personal
taste and choice. Just allow that we also use and in some case prefer Unix
apps, which are kinda "invaders".

I will howewr disagre bout AES part. N.AES is not lousy at all, it is
very good AES. Im aware that its unstable for u, and u realy must have
something wrong there, i am, if u are willing, to help fixing u that. Not
to convert u from Magic to MiNT, but simply to prove N.AES is very stable
and powerfull AES.

:))) Criticisng is okay, or even better, disliking... But when u do climb the barricades, u do that with pomp and bombs and heawy weapons.. U dont stop on bashing XXX apps, but attack whole comunity, coders and so on. U realy think i went berserk, sent u a mail, cause i had bad day in office?

Also i never hear u calling CAB or XXX app, which u consider real one, programmers loosers and use names u use for MiNTers.

> If something is good I'll say it also, Anodyne has ported over mkisofs2,

Why u think ppl bother to make GEM frontend for cjpeg/djpeg, pop3 Gem front end, Tarit (tar packer front end) or MiNt Setter (Frederic). Or RPM front end. Those ppl could be happy with CLI versions, they know how to use them. I have feeling, but i can be wrong, those not interest you, since free apps and MiNTers did them....

Well all apps simply cant run on all 3 OS-es. Not cause "other" 2 are bad, but because they lack Unix envoirment.

> In a different thread Maurits and Frederic are telling me to be realistic

> a nice MS Windows replacement with apps that even have the same look and
> feel....

I can actauly agree to that. And im am Unix fan, but id never install Linux on Atari, because all ill got is slow Linux box, soul less computer. Linux is infact great os, has many advantages over Windows, its Unix. And Unix is a way to go, no matter if its CLI or GUI only. What makes it better from Windows is portability. So if Joe Average migrate from his PC to g5 Mac, with Linux he will be able to use same apps, he love. Same if he will migrate to SGI, or Sun etc.. Thats is real advantage, not pure fact is Unix or whatewer... Thats strong points of Unices...

But Linux is "System Unifier": PC, Mac, Amiga or Atari are all same under Linux, minus speed diferences. PC is dull anyway, so migrating to Linux actualy freshen things up. On Atari Linux for me means killing the great and special machine, the also great apps and feeling.

There is where MiNT jumps in, it just add Unix cookies, but in core it stays native Atari OS. So Janez Average can fully enjoy GEM, and all what he likes on GEM, its services (av server, dhcp bla bla), his fauvorite

feeking. And occasionaly or more often, run some unix apps in parallel, without rebooting, exiting GEM. And if use Unix stack, like NFS, all his fav apps will be able to use that resources, if NFS Thing will display remote machine hdd in window, same as own hdd's, if MiNT net, CAB, or ASH emailer will be happy, and Janez average too, since he is able to run CAB with SSL, or use "non native" W3M if he need to do some bank transfers, if amigaFS.xdd he wil lbe able to read Amiga hdds, and so on.. And u alone said there is lack of new productions, and that lack wont go away im affraid.

> Now let's warp back to this platform, the stuff that is ported over

> newsgroup he's told that these are dirty hacks and to get rid of them.

Realy, i thought we cleared that... EasyMiNT is easy to install package, it cames in few archives though, since its not small, and one can choose not to install compiler archive, or X11 archive or manuals archive (not advised if unix nevbie, since without manuals will start to bash other users...) Reason why AES and Desktop arent bundled is because they are commecial/shareware. Also whoever know me on orc or whatewer, knows that me and others, spend any time needed there in case of troubles. Learning curve is a bit steep, i admit. Dennis (Joe Average here) didnt ask me to maybe help his NAES troubles, its easier to accuse all us here we defend shitty AES and to declare N.AES shitty. Effective way to scare ppl off.

About saying that installers are for sissies is pure lie... in last few days EasyMiNT and SpareMiNT were mentioned more that once... I did, in KGMD days lead ppl on IRC step by step, and had (still have) opinion that some manual work actualy help newbies to grasp some cli basics. Since those were needed for KGMD.

Joe Average was proposed MiNT (and also in cases that he has the powefrull enough machine for it) simply because there is a lot of Joe's asking for ethernet cards, to have their machines in LAN to PC/MAC or to accesing internet via them, or cause Joe was in seek for pdf readers, etc...

BUT ill stop that here... I see Dennis again start twisting. NOONE propose Joe that he need to use odd "alien" apps only! Those are apps/drivers we dont have in TOS/MAGIC. Also the hanging etc remarks are fiction, neatly inserted in text. In reality, same bad app which crashes MiNT will do same to the Magic. Altough in 90% of cases those are older apps and crash is not realy crash, just badly returned screen adress, i also did produce some of such "gems". Easy to solve, i did told the solution here, but if noone wana listen what can i do? Im sick of this....

P.S: U all heard my reasons for MiNT, my view on Magic, which i do use happily, and consider realy nice small OS (and small not meant as insult!) i gave out some explanations, SpareMiNT links, explain why miNT now is not cowboy OS anymore (as it was on begining), and why i think it has future (fixed SparMiNT package, ne need to adopt apps, since they can be compiled. Not as good option as to get new GEM apps, but sadly those are close to 0 in development. And mainly, since we dont have to abandon any of ATARI flavors!) My offer for desktop snaps (to see i do run ATARI os) still stand, offer to help and try to resolve probs stand even more... Its up to you to decide now, i said what i have to say, u guys have own head, i wont repetitive wash your brains as Dennis does...

I only ask for one thing: Do NOT insult developers of OS/apps u dont need or u find them useless for u etc. Those guys work hard, all for our platform. As i said, if they would be realy some Unix junkies and wouldn't care for TOS platform, they would use Linux and port apps to Linux, not to sweat over nasty and odd probs, trying to merge Unix and TOS world, which sometimes can't be ultra neat solutions. Lack of "/:" partiton and U: drive is only way not to harm TOS applications useability! And thus this solution, there are few links to be made in so HATED mint.cnf...

lp, Janez

For goodness sakes, no one has said switch. I never seen a post that
said anyone should switch. The issue simply is how you so easily write
anything off that you don't like as worthless. The situation is
identical at our end, the handful of apps that won't run on my mint setup
are labeled "alien", and so I simply do not use them. I also DO NOT
jump into usenet and start spouting off anything negative about these
programs or their authors. I simply find another tool to do the job
and since I use mint, I have many more possible solutions, that is
the only real difference when it comes down to it. Actually this
is not the place to air comments about a program, and I can understand
that upsetting you. Myself, I might send them an email with some bug report
or such. The next time that happens just try to stay a bit more calm

and such, tell that person to contact the author or provide the authors email. Don't go off half cocked and stoop to the same level, because that is what you are doing. All that swe asks, and I ask, and Martin and anyone else who tried to explain the value of the unix option, is a little more tolerance on your part. I even apologized for my previous comments in another post. I understand your position, I use to be there myself at one time. You might be perfectly happy to suffer, and be without some specific tool, but there are people who are willing to go that extra mile and obtain that tool even if it don't resemble a gem app.
The original TOS ROMs always had the ability to to run TOS and TTP apps, which had no GEM gui so I don't agree one bit that the unix apps look nothing like ST apps. But please try to be a little more tolerant, and accept that others simply go down a different path. I'm ok with people using magic, if it does the job you need, fine. It just is not the right solution for me and others. I also don't agree with your comments on naes, but looks are too subjective, I equally don't like the look of magic, but that's here nor there.
I think we all can have calm discussions, but it starts with tolerance and understanding that everyone has different needs. An example is demos or games, I've never had much use for either, but that don't mean others don't enjoy that stuff even if I don't. I do respect the work that goes into them though. Those hardly ever resemble GEM apps either. ;o)

Dennis, please stick to the thread.
OS issues, not hardware, I know you know the difference.
In what way does using magic as opposed to other OS helps your TT playing
mp3 files?

Unrelated. Please drop this hardware issue.
